If you really mean that the IP address is not being saved on the hardware screen, please note that Quisk saves its settings in a file named quisk_settings.json in the default config file location. Check if somehow you have two such files.

If you start Quisk 4.0.0 and do nothing else, nothing should change. I don't know why the audio is different. If you create a radio, and start that radio, the audio could be different because the settings are different. To check this, set "Ask me" when quisk starts, and request "ConfigFileRadio" as the startup radio. Then only your config file is used for settings, and everything should be the same.

I like this concept of "radio" in the selections ....

I can use my SDR hardware on the fundamental or harmonic and i think a second radio setup can be setup that way ...

looking forward to try that .....

Hello Graeme,

Thanks for your careful work in testing Quisk.

---In n2adr-sdr@yahoogroups.com, <gvjury@...> wrote :

>1. Using pulse the audio levels are very low

There was no change in PulseAudio. Are you using "mixer_settings" in your config file? If so, and if you rename (stop using) your config file, mixer_settings will not be used because it is absent from the new config screens. But you can fix this by retaining a config file with mixer_settings in it. If you are not using mixer_settings, this is a mystery.

---In n2adr-sdr@yahoogroups.com, <gvjury@...> wrote :

>2a. The DX cluster does not work
>quisk_settings.json: "dxClPassword": "None",

Thanks for taking the trouble to scrutinize quisk_settings.json. It looks like your config file has lines that set some of the dx cluster parameters to Python "None". The Python "None" object is never a valid setting for any of these parameters. You must use the null string "". I see a problem here. The config file will work correctly with None, but the settings screens are more strict. Maybe I can fix this. Meanwhile, go to the radio/Remote settings screen, and change any None entries to blank.

>2b. The last line in the "Start Quisk with this radio" selection box is always partially obscured i.e. the window does not grow enough to fit in the last line although it does expand to fit extra lines of radios.

I do not see this at my QTH. Also, the selection box is supposed to show a scroll bar if there are too many items.

>3. I lost my favourites and would like to know where Quisk defaults to as I have an old copy of "quisk_favorites.txt" which I would like to put in the default position.

The default is the location of your config file, but there is an option to change the location in your config file. The config file default is Documents on Windows, and your home directory on Linux. There is no option to set it from the settings screens (yet).

>4. When replaying a recording made from the record button on the top row of buttons, it does not replay correctly when using LSB as the audio is inverted. When replaying on usb everything is normal.

That is odd. If I understand correctly, the audio is monophonic, and there is nothing to invert.

Thanks again Graeme.

Hello Ian,

>I then reinstated .quisk_conf.py & again restarted Quisk and it's still OK

You don't need to reinstate .quisk_conf.py unless it has items you need that are not on the config screens. For example, custom colors, hotkeys or band plans. In any case, your config file be reduced so it does not have any items that are on the config screens.

>Traceback (most recent call last): etc, etc, etc.

That is caused by the very long PulseAudio names. It is a bug and I will fix it.

Hello,

>It would be nice when starting Quisk if I could have the alsa loopback to be an option so I can do a menu item of "HiQSDR alsa Loopback" vs "HiQSDR alsa"

I am confused. On my machine, the alsa loopback devices do appear on the list of sound devices.

You can make a radio named "HiQSDR alsa Loopback" and another named "HiQSDR alsa" and another named "HiQSDR three". The settings can all be different, no problem.

Thanks Jim

I do have a few things in .quisk_conf.py that I'll keep: colours, bandmaps (e.g. UK 60m allocations).

I'll work to get rid of the duplications with the config settings though.

>>2b. The last line in the "Start Quisk with this radio" selection box is always partially obscured i.e. the window does not grow enough to fit in the last line although it does expand to fit extra lines of radios.

> I do not see this at my QTH. Also, the selection box is supposed to show a scroll bar if there are too many items.

Yes there is a scroll bar. I have posted 3 pictures to show what I mean.

2 Radios fit into the screen
3 Radios is obscuring the last line partially and the scroll bar is active.
5 Radios has grown the list box but not enough to show the last radio. Again you can scroll to it.

Its a cosmetic issue and not important. I just wanted to point out that if the list box can grow (probably up to a defined limit) as 5 Radios show, maybe the 3 radio box could be grown a little more to show the last radio and not make it necessary to scroll. Perhaps even the 5 Radio list could extend more also. Again its only a cosmetic thing.

Hi Jim,

I will stick with one issue per message to keep things from becoming confusing.
I have cleared the "Password for DX cluster" and checked that the quisk_settings.json file reads null.

"lin_microphone_name": "pulse:hw:0,0",
"dxClPassword": "",
"station_display_lines": "3",

but I still get this error message on startup and the dx cluster won't connect. In case there is a hidden character in the file I have also tried typing the line in by hand.

Exception in thread Thread-2:

Hi Jim,

Yes I see you need to be clairvoyant to follow my question :-(

>>It would be nice when starting Quisk if I could have the alsa loopback to be an option so I can do a menu item of "HiQSDR alsa Loopback" vs "HiQSDR alsa"

>I am confused. On my machine, the alsa loopback devices do appear on the list of sound devices.

What I meant was to avoid having a permanant loopback setup by having a modprobe command in /etc/rc.local, I wanted to run "modprobe snd-aloop" prior to launching Quisk. I originally thought of a startup script but then considered if I wanted to run pulse I would need a different command so it would need to be linked to the radio choice. Anyway this is getting too complicated and a long way from what you are achieving right now so lets consider it out of scope and I will revisit it another time.

>>4. When replaying a recording made from the record button on the top row of buttons, it does not replay correctly when using LSB as the audio is inverted. When replaying on usb everything is normal.

>That is odd. If I understand correctly, the audio is monophonic, and there is nothing to invert.

Quisk replays the recorded audio on the upper sideband only, regardless of whether Quisk is set to LSB or not. The distant station report threw me as they made it seem that the audio was in channel.

One option for the future would allow switching between Radios on the
fly within quisk.

I now have quisk running MyRadio on ODROID-U3 and HL227 on x86_64 singly
configured for 192.168.10.227 manually entered although it gets its
persistent IP address via dhcp.

From: Eric Thornton
Topic: 1893 Message: 1920

Finally had some time to test 4.0.0 with radio configs.

-Softrock TX level is not saved with the radio config and now
mic_out_volume seems to be ignored from my config file. It always defaults
to 0.7
-A few options missing from the soft rock screen to make remote operation
complete. I'll fix this.
-Quisk is very slow and unresponsive on OSX when starting without a config
file since there are no Alsa devices and it is stuck in a loop looking for
either samples or devices. I'll look into this and see what I need to do to
fix this issue. Doesn't happen on my Ubuntu laptop. Not a problem once it
is configured.

I don't see this at my QTH. If "Ask me" pops up a radio selection box, and you select HL227, and you change to the Radios screen, Quisk should say that it is running with settings from HL227. Also, the tab for the radio should look like this: "*HL227*". The asterisks indicate the radio settings in use.

Hello Sid,

OK, I see the screenshot. And the HL227 is indeed the radio in use just as you requested. And the hardware type is Hermes, which is correct, and the settings for Hardware look OK. Are you saying that the settings are wrong for this radio in that 192.168.10.227 is not the actual IP address that the hardware is using?

If 192.168.10.227 is the correct IP address you entered, but the Hermes-Lite is not using that address, then the issue is with the Hermes-Lite, not the new Quisk features. At my QTH, the IP set feature does not work unless the Hermes-Lite has obtained an address from DHCP first. Try turning on the Hermes-Lite and waiting until it has a DHCP address before starting Quisk. If that does not work, leave the Hermes-Lite on, exit Quisk and then restart Quisk.

The Hermes-Lite IP set feature is most useful for those lacking a DHCP server, so please test.

Hello again Jim

In fact I do have another problem which I discovered when when I went to start stripping out my .quisk_conf.py file: no tabs are displayed for the individual radios (neither "ConfigFileRadio" nor whatever I call my HiQSDR when I create it).

Possibly related: if I start Quisk with no pre-existing config files, then select Config, then the Radios tab & then ask it to create a new radio I get a different (but similar) wxPython error to the other one:

```
Traceback (most recent call last):
File "./configure.py", line 800, in OnBtnAdd
if local_conf.AddRadio(name, typ):
File "./configure.py", line 225, in AddRadio
page = RadioNotebook(self.notebk, radio_name)
File "./configure.py", line 421, in __init__
page = RadioSound(self, radio_name)
File "./configure.py", line 1118, in __init__
cb = self.AddComboCtrl(6, self.ItemValue(r, 4), choices=dev_capt)
File "./configure.py", line 631, in AddComboCtrl
cb = ComboCtrl(self, value, choices, no_edit)
File "./configure.py", line 452, in __init__
self.SetSizes()
File "./configure.py", line 468, in SetSizes
self.SetSizeHints(wm, self.height, 999, self.height)
File "/usr/lib64/python2.7/site-packages/wx-3.0-gtk2/wx/_core.py", line 9718, in
SetSizeHints
return _core_.Window_SetSizeHints(*args, **kwargs)
wx._core.PyAssertionError: C++ assertion "(minW == wxDefaultCoord || maxW ==
wxDefaultCoord || minW <= maxW) && (minH == wxDefaultCoord || maxH == wxDefaultCoord ||
minH <= maxH)" failed at ./src/common/wincmn.cpp(1046) in DoSetSizeHints(): min
width/height must be less than max width/height!
```

Quisk does then allow me to create a radio and it writes a quisk_settings.json file, but I can't then edit any of the settings (since there's no tab to select).

Not sure if this is something to do with my set up. I'm running Arch so some of the packages may be different versions than Ubuntu and others are currently providing.

Is there anything else I can do to test?

Cheers
Ian

Hi Jim,

i also have a few feedback:
The hamlib control of the 2nd RX seems to work well. If split is switched on the 2nd RX frequency is reported and also this VFO is set via hamlib. The TX frequency stays untouched. If split is switched off the TX VFO is controlled. The only thing i do not understand is in the GUI the selection right of the split button. You have there "Hamlib control TX" and "Hamlib control RX". But it does not make a difference what i set. In split it always controls the 2nd RX and without split the TX. That might be different from than you intended.
I did not try much more so far. But thats already really cool.

Hi Sid,

You may have read on an earlier post of mine that I had problems with low audio levels. It seemed whatever I did it would not improve so after an evening of messing around with settings I shut the machine down for the night. When I ran the machine up the next day my audio seemed to be back to normal. I am sure it was not Quisk that was the problem and my lesson from this is if you are playing around with pulse, restart it after major changes.

Subject: [n2adr-sdr] Re: Quisk 4.0.0

If you start Quisk 4.0.0 and do nothing else, nothing should change. I don't know why the audio is different. If you create a radio, and start that radio, the audio could be different because the settings are different. To check this, set "Ask me" when quisk starts, and request "ConfigFileRadio" as the startup radio. Then only your config file is used for settings, and everything should be the same.

1941. Quisk 4.0.0 - split freq - sound on digital_output

Yahoo group: n2adr-sdr
Date: 2015-11-25 10:20:16 UTC
From: michael.hartje@...
Topic: 1941 Message: 1941

hello List,

Quisk 4.0.0 is a nice step further - but I fear, that the spilt frequency function has changed.

In the past (3.7.8 and below) with spilt freq receive the sound was sent to left and right channel - also on digital_output to feed fldigi, wsjt-x for example with both or selected channels.

In quisk 4.0.0 the sound is send to the audio output left and right channel, but not to digital_output -- just one channel!

So the question is -- have a missed any further configuration variable? -- I let the split_rxtx = 2 (as before)

Or is it a change in pulseaudio interface of the new 4.0.0?

Thanks
vy73

Hi,

This is the same bug as before. You can change line 468 in configure.py to:

self.SetSizeHints(wm, self.height, 9999, self.height)

Note the change from "999" to "9999". That should fix the problem.

The "Hamlib control TX" and "Hamlib control RX" will set the correct frequency if Hamlib calls set_split_freq, so it depends on what Hamlib does. I find Hamlib a bit of a mystery, but I will change Quisk if anyone wants to research this.

I don't think there was a change in Split. The setting split_rxtx from the config file is now on the radio Options tab, and is called Split-mode audio. Just set it there.

The config file for each radio ?

I would like to have different favorite lists for the different radio configs ...

Im going to use the same hardware .... but want one used on a 3rd harmonic (ie VFO is set to 1/3 the display)

Im looking to use my UHFSDR into the microwave bands ....

Is it possible to configure quisk in that fashion?

Hi Jim,

Sorry but there are new bugs in Quisk-4.0.1 but probably associated with already reported 4.0.0 ones.

1.

When using a copy of quisk_conf.py for a new radio, the cluster can't be accessed. This is previously reported and no doubt on your bug list but there is a change on behaviour whereby there is no longer a pop up window with the error message so I have copied the text from the terminal window ...

```
gvj@gvj-Mint ~/Programs/quisk-4.0.1 $ python quisk.py
open_wav failed
ALSA lib pcm.c:2239:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.rear

if IAC in buffer:
UnicodeDecodeError: 'ascii' codec can't decode byte 0xff in position 0: ordinal not in
range(128)

Killed
```

Note when I exited quisk the program locked up (another previous report) and I had to kill it.

2.

When starting from the "configFileRadio" the sound would not work as shown on the terminal printout and the attached screenshot. Note that a radio created from the configFileRadio works fine except for the cluster access.

```
gvj@gvj-Mint ~/Programs/quisk-4.0.1 $ python quisk.py
open_wav failed
ALSA lib pcm.c:2239:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.rear

Hello,

This line:

File "./dxcluster.py", line 111, in telnetConnect
self.tn.write(conf.user_call_sign + "\n")

makes me think there are garbage characters in your call sign. Go to the radios/Remote screen, and re-enter your "Call sign for Dx cluster". Or, look in the file quisk_settings.json and see what value user_call_sign has. Or just send me the file quisk_settings.json.

Ah... It works if I change dxcluster.py like this:

```
def telnetConnect(self):
self.tn.open(conf.dxClHost, conf.dxClPort, 10)
self.tn.read_until('login:', 10)
# self.tn.write(conf.user_call_sign + "\n")
self.tn.write("G0IZM\n")
if conf.dxClPassword:
self.self.tn.read_until("Password: ")
self.tn.write(conf.dxClPassword + "\n")
```

Topic: 1949 Message: 1956

I wish I had spent some time learning Python but it seems to me there may be a bug in the code around line 112 of dxcluster.py which reads self.self.tn.read_until("Password: ") and I think should be self.tn.read_until("Password: "). It works for me if I make this change.

```
def telnetConnect(self):
self.tn.open(conf.dxClHost, conf.dxClPort, 10)
self.tn.read_until('login:', 10)
self.tn.write(conf.user_call_sign + "\n")
# self.tn.write("ZL2APV\n")
if conf.dxClPassword:
# self.self.tn.read_until("Password: ")
self.tn.read_until("Password: ")
self.tn.write(conf.dxClPassword + "\n")
```

Thanks to Ian g0izm for pointing me to here.

Topic: 1949 Message: 1957

A bit more testing reveals that although changing the line
self.self.tn.read_until("Password: ") to self.tn.read_until("Password: ") fixes the the problem of Python "None" not reading, it still does not allow logging into the cluster. It is still necessary to set dxClPassword": to blank so the ...

```
if conf.dxClPassword:
# self.self.tn.read_until("Password: ")
self.tn.read_until("Password: ")
self.tn.write(conf.dxClPassword + "\n")
```

is skipped and nothing is sent.

Agreed - I don't have a password set so haven't run in to that one. It's just the complaint about conf.user_call_sign that's causing me problems.

As far as I can see the variable is fine: its contents look identical to the callsign I hard-coded in. Maybe there's some wierd Unicode problem going on.

Graeme I think you're right. I don't have a password set though so for me that line won't get executed.

What I don't understand so far is why it's complaining about conf.user_call_sign. It just contains my callsign as expected - I checked with an IF statement and as far as Python's concerned it's identical to the hard-coded value I typed in. Some wierd unicode thing..?

Hi Ian, Yes it seems that sending log in info via the telnet library may
be an issue. Stuff being received or sent via the library is fine once
you have successfully logged in. I know I ran into problems with Qt
whereby ascii characters were sent as 8 bit chars to software which
expected 7 bit chars so they needed to be streamed through a function to
strip off the 8th bit. Maybe it is something like this here.

Your quisk_settings.json looks correct. Maybe the string is a Unicode string, and the telnet library can't deal with it. Perhaps you could try:

```
def telnetConnect(self):
self.tn.open(conf.dxClHost, conf.dxClPort, 10)
self.tn.read_until('login:', 10)
self.tn.write(str(conf.user_call_sign + "\n")) # Add str() here
```

to convert
conf.user_call_sign + "\n"
to a string. You could also try entering a line like this

```
print (type(conf.user_call_sign))
```

to see what the type of conf.user_call_sign is.

Never mind, I see what is happening. The JSON file that holds settings is returning Unicode strings instead of regular Python non-Unicode strings, and these are not acceptable for the Telnet module. I am not sure what to do about this, but I will do something for the next release (soon). Meanwhile change:

```
def telnetConnect(self):
self.tn.open(conf.dxClHost, conf.dxClPort, 10)
self.tn.read_until('login:', 10)
self.tn.write(str(conf.user_call_sign + "\n")) # Must add str() here
```

You must add str() to the last line shown to convert Unicode to ASCII.

From: Graeme Jury
Topic: 1949 Message: 1965

Thanks Jim,

All working fine now. Lines 108 to 114 now read in my dxcluster.py file ...

```
def telnetConnect(self):
self.tn.open(conf.dxClHost, conf.dxClPort, 10)
self.tn.read_until('login:', 10)
self.tn.write(str(conf.user_call_sign + "\n")) # Must add
str() here
if conf.dxClPassword:
self.tn.read_until("Password: ")
self.tn.writestr((conf.dxClPassword + "\n"))
```

I did the same thing with the last line but have not been able to test
it as I don't have a password set for my cluster access but at least it
does not throw up a compile error.

Didn't see this one in the documentation, so asking here. I have a SoftRock Ensemble RXTX transmitting via Quisk 3.7.7 on my Raspberry Pi, and it appears to be working quite well. Monitoring the signal on an Elecraft KX3 shows a nice clean signal on 30 meters. However, I notice that at the beginning of a key-down, the frequency display in Quisk changes from black numbers on a white background to black numbers on a magenta background. If I hold the key down, the white background re-appears after a second or so. Is this normal or something I need to fix somewhere?

You can now add "pulse_audio_verbose_output = 1" to your .quisk_conf.py file, and lots of helpful pulse audio debugging info will be displayed. If you are experiencing issues with pulse audio, this can help us figure them out without having to recompile from source.

I also removed a line that was resulting in latency on the IQ device if the computer was under heavy load.

1973. Quisk and SoapySDR

Yahoo group: n2adr-sdr
Date: 2015-12-07 21:31:46 UTC
From: frspin@...
Topic: 1973 Message: 1973

I am studying Quisk for interfacing it to SoapySDR, a "neutral" library for different SDR receivers.

SoapySDR have a C API, a C++ API and a Python API and don't use a sound card or UDP for I/Q samples. See https://github.com/pothosware/SoapySDR https://github.com/pothosware/SoapySDR for source of this library.

I suppose I can use Python API in my quisk_hardware version for controlling SoapySDR (frequency, gain, etc.)

From sdriqpkg I can see the usage of quisk_sample_source() C function defining start, stop and read functions.

It is a "C only" solution?
And can I use C API for this definition and Python API for all other requirements?

Hello All,
Wandering does someone has success to run Qusik on MAC OS X El Capitan?
I can successfully install and compile Qusik 3.. and 4.0.0 on my MAC, I can even to start it, but :
- No waterfall or spectrum
- no any interrupts I can see in Configuration tab
I am tested Qusik with configuration for different hardware (Softrock, Hermes, AFEDRi SDR - with external plugin etc.) same results, In same time there is no any problem to run Quisk with same hardware under Windows or Linux..

Additional question which names in .qusik_conf.py you are using for Sound cards?

Alex,

I'm using quisk with osx Mavericks. It should work with el Capitan. I would suggest installing the dependencies via macports and then selecting the macports version on python. This is done with "sudo port select python". Then run quisk from the folder with "python quisk". To build with macports dependencies, type "make macports" in the quisk folder.

I am using pulseaudio built from macports and it works well for channeling sound between programs. Unfortunately there is no pavucontrol so selecting streams for programs like fldigi and wsjtx have to be done with pacmd.

Let me know if this helps. I plan on making quisk a macports port, but have been busy with work lately. Maybe in a couple weeks over Christmas I'll have time to work on it.

Eric

Eric, Thanks for the feedback.
1. I am using Homebrew to manage and install ports for MAC
2. make macports finishing successfully (after changing paths from /opt/local/... to /usr/local/...)
3. I can start Quisk, but it is hanging ,
Sample interrupts is zero.

I have also next message:

W: [] caps.c: Normally all extra capabilities would be dropped now, but that's impossible because PulseAudio was built without capabilities support.

By the way I know that Apple is frequently changing some API from version to version, so it is not always compatible and things that worked in the older version can fail on newest .

I am new in MAC OS X, so not sure what is the problem

Alex,

For versions 4.0 and >, this would be normal behavior with no radios configured. Are you using an existing .quisk_conf.py file? On Linux systems, quisk will fall back to an Alsa device with no configuration present. On OSX, we don’t have Alsa to fall back on, so the program doesn’t do anything until a pulse audio device is selected and quisk is restarted.

Try going to the configure tab and configuring a new radio to use the pulse audio devices available on your system. Alternatively, you can use the command pacmd such as “pacmd list-sinks” or “pacmd list-sources” to see what is available and add them to your config file.

The note about “caps.c Normally all blah blah” is normal and seems related to the macports configuration.

Let me know if this makes sense.

Eric

Might be the way that gcc that came with Ubuntu15 searches for stuff ...
gcc 5.2.1 is installed

```
uhfsdr@uhfsdr-sdr:~/Downloads/quisk4$ sudo make
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
i686-linux-gnu-gcc
-pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -D_FORTIFY_SOURCE=2 -g -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c
quisk.c -o build/temp.linux-i686-2.7/quisk.o
quisk.c:1:20: fatal error: Python.h: No such file or directory
compilation terminated.
error: command 'i686-linux-gnu-gcc' failed with exit status 1
makefile:3: recipe for target 'all' failed
make: *** [all] Error 1
uhfsdr@uhfsdr-sdr:~/Downloads/quisk4$
```

1982. Re: [n2adr-sdr] Quisk on MAC OS X El Capitan (10.11)

Yahoo group: n2adr-sdr
Date: 2015-12-09 07:37:13 UTC
From: alex@...
Topic: 1974 Message: 1982

Eric,
May be I have problem with Pulseaudio, because none of pulse audio device is listed in Quisk, but existing sound cards appears with name alsa:"bla...bla..bla"

But exactly the same problem I see when running Quisk 3.7.8.

I am using quisk_conf.py - that is perfect working on Linux (and some modified on Windows too), for sure I tried to play with sound card names in config file, for example to using portaudio names or Windows stile names - no results.
By the I am wandering why there is no support for portaudio devices?
Portaudio port is working on MAC OS X, may be portaudio is disabled for MAC in Quisk?

For example I can use (compile) portaudio device with Linrad (or my own utilities), without problem (I do not take in account MAC OS X future audio API deprecation warnings).

73!
Alex

1983. Re: [n2adr-sdr] Quisk on MAC OS X El Capitan (10.11)

Yahoo group: n2adr-sdr

From: alex@...
Topic: 1974 Message: 1983

Now I can give some more input data. I can conclude that somewhere inside code quasi is hanging, do not know where exactly, but I found next things when starting Quisk:
1. When configuring to portaudio I can listen decoded audio (but no waterfall or spectrum graph) - during short time when I make click on any buttons :-)
2. If I will press S-meter list box menu - I can listen uninterrupted decoded audio (but no waterfall or spectrum graph) till I hold this list box activated.

3. Once I had success to start Quisk and it was functioning normally including waterfall and spectrum graph !

Why it was running ok? - I do not know, did not found any causes why quick decided to start normally this time - always using the same config quick_conf.py located in user's folder. After closing this successful quisk instance - next start was problematic exactly like described above.
4. Additional signs - when quick has problem to run - I cannot close application just pressing X in left top graphic window, also have to press Ctrl-C in terminal to finally close (kill) application.
One time when Qusik was started successfully - application was also successfully closed with "X" button.

5. Using:
portaduio#2 - as input, portaudiodefault as output.

Is there any idea where to look for possible hanging thread that stops reception?

73!
Alex

There is a new Quisk 4.0.3. This is mostly a bugfix release. It changes Unicode JSON strings to ASCII. It adds additional PulseAudio features provided by Eric Thornton. Thanks Eric!

Just tried Qusik 4.03 - the same results, below is two screenshots:

I want to remind if I press some button on press list box of S-Meter (or any other)
I can listed decoded station (SSB or AM or FM), but not Waterfall or spectrum (see my screenshots).

Any idea where is the process is hanging?
How can I test where is stop?

73!

Alex,

Can you post your configuration file. Also, please add pulse_audio_verbose_output = 1 to your config file and post terminal output. Also post results of "pacmd list". Sounds like pulseaudio is not starting correctly.

Thanks.

Eric, Below in my message you will find quote from my config file. But I see that you missed my explanation - I do not use (and prefer not to use at all) Pulse audio (I do not use/like pulse audio interface also on Linux).
I want to use port audio interface and according my test it must perfectly work on MAC OS 10.11, but some process is frozen.
By the way I do not think my problem has connection to audio interface (because I can receive IQ data from USB sound card and listen decoded through MAC sound card) when I press any of list box of Quisk. So to find which process is frozen in Quisk I need more information how thread are managed and how to find frozen thread.

```
#---------------------- .quisk_conf.py ---------------------
from afedriusb import quisk_hardware sample_rate = 192000 name_of_sound_capt =
"portaudio#2" name_of_sound_play = "portaudiodefault" default_rf_gain = 14 default_screen
= 'WFall'
playback_rate = 48000 #--------------------------------------------------
```

Ah, I see, the package from the repo is already built so it doesn't need
python2.7-dev which supplies Python.h and I suppose the other -dev packages.

On a fresh install I install all the pre-reqs needed for ghpsdr3-alex,
then for quisk
"apt-get install libfftw3-dev libasound2-dev libportaudio2
portaudio19-dev libncurses5-dev libwxbase2.8-0 libwxgtk2.8-0
python-wxgtk2.8 python-wxversion libusb-dev python2.7-dev"
73 ... Sid.

Topic: 1974 Message: 1993

Alex,

OK. Sorry I've been super busy at work (just getting home) and was trying to help by skimming and missed that you are trying to use PORTaudio.

The "make macports" target will only build in pulse audio dependencies now. I tried adding in sound_pulseaudio.c just for giggles and it died complaining of duplicate symbols. I know I ran into that earlier and tried to keep it so that if someone running OSX wanted to use port audio (or non macports dependencies for that matter), they could modify setup.py and run "make" for their own configuration.

I would love to jump in tonight and fix this, but I need to get a couple hours sleep before going back to work again tomorrow. I can take a longer look at it this weekend, probably sunday afternoon. I think the proper way to fix this is to supply an option to the make command, specifying which audio devices to build in. Or, I can just make port audio a full time dependency on OSX.

On a side note: Have you tried the pulse audio interface? I used to think pulse audio was added complication to an already complicated audio system, but after working with it I've come to prefer it. We've made big strides in getting the bugs out and the latency down. I'm not much of a salesman (which is why I went into engineering) but give it a shot!

Eric

Eric,
Please pay attention that on my system (I am using Homebrew not macports), I need to make only one thing - to correct path to ports library and includes in setup.py from /opt/local to /usr/local

After that Compilation "make macports" is running perfectly (on every Quisk version I tried 3.7.8 , 4.0.0, 4.0.3), there is no errors at all.

I maid some modification on 4.0.0 and completely deleted everything related to pulseaudio , same result - Quisk starting and frozen in non audio/non waterfall state till I activate some list box menu, after menu activation - I can listen decoded audio, but no waterfall.

I have no tested pulseaudio yet - it deny to start on my system , but in any case even if it is starting - I remove/delete everything related to pulseaudio even from my linux systems, may be it is good for network audio streaming , but too over-complicated for local audio..

I also suppose that best way - will be to use native for MAC OS X CoreAudio API, there is chance that in this case we will have best latency with embedded sound card.

If someone can shortly explain to me how Quisk threads are managed and how I can find which/where is frozen, so it will make easier to track this problem to me.
73!

1995. Re: [n2adr-sdr] install quisk on new system

Thanks Mike,
I knew if there was a hole you would find it.

Looking back at a README_G7VAC.txt I prepared for my pal Vic when he
first got his RXTX and had problems getting quisk from the repo to work,
I had to add those packages to get a later quisk version built.
ghpsdr3-alex adds a number of packages that are useful for building
other apps.

Keeps us on our toes.
73 ... Sid.

Quisk can already be controlled by Hamlib and by XMLRPC. Cat control requires a serial port. Are you proposing using a serial port to control Quisk? Why aren't existing control methods adequate?

Jim, Did you wrote this message in the wrong topic?

I am have the troubles on MacBook Pro with MAC OS X El Capitan (10.11 - 64-bit)
Trying Quisk 3.7.8, 4.0.0, 4.0.3 with AFEDRI SDR-Net in USB mode.

But SDR hardware is not issue, because AFEDRI is represented on MAC OS as USB sound card, for sure I have additional folder (for SDR control support) with quick_hardaware.py to control SDR's parameters like frequency and gain, but it can be totally disabled - same results (by the way when enabled - all controls are working fine).

Same setup is working fine on Windows and Linux OS.

1999. quisk and sound loop

Yahoo group: n2adr-sdr
Date: 2015-12-11 01:43:51 UTC
From: MIKE DURKIN
Topic: 1999 Message: 1999

i have the latest Quisk and i still cant get Fldigi and Quisk to pass audio anymore ....

Im currently using the monitor of the soundloop for fldigi for Rx ... thats working (just not quite right, should be able to use the loop)

The Tx on the other hand only has the sndloop (no monitor) and will show in pavucontrol that Fldigi is sending audio to the sndloop, but quisk is not resending the information to the I/Q for the Radio to Tx ...

yes Tx of radio is triggering ....

any ideas to check ... ?

Hi Mike,

The method I'm most familiar with and have done all the testing with is using null sink monitor streams for passing between programs. What is a soundloop device?

Virtual COM ports is alive ! CAT is a best method for synchronisation, becose it is standart for any programms.
I think, QUISK needed CAT.

snd-aloop.ko is a kernel module. When loaded it creates a virtual sound card called Loopback as shown below.

```
root@odroidu3:~# modprobe snd-aloop
root@odroidu3:~# cat /proc/asound/cards
0 [Audio ]: Built-in_Audio - Built-in Audio
Built-in Audio
1 [Device ]: USB-Audio - USB Sound Device
USB Sound Device at usb-s5p-ehci-3.2.4.4, full speed
2 [Loopback ]: Loopback - Loopback
Loopback 1
root@odroidu3:~#
```

It's specific use by quisk is desscibed in the quisk documentation.

About CAT i am not sure how useful it would be to have it inside Quisk. For my opinion the Hamlib and RPC control is very useful and for my use-cases it is sufficient. But i can also understand that someone might want something that enables for interfacing with external hardware that does not require a network interface. But maybe the more efficient way is a external tool that works with Hamlib or XML-RPC. That could emulate a CAT interface with some common used CAT language. My proposal would be the K3 CAT interface. But as i said i think that does not necessarily need to be a part of Quisk. What do you think ?

I didn't think there was such a thing as a common CAT language looking at hamlib/grig. So many rigs with different features.

When working with the hamlib group to get support for the IC-737 it was obvious that code specific to that transceiver was necessary though the hardware interface was the same for Icom HF transceivers.

Hello All, I see no much interest to Quisk on MAC OS X El Capitan here, in any case hope my information will help someone.

As I supposed the problem was not in sound management, after hard work and time spent to problem debugging - I am sure that there is something broken inside python2.7 / wxpython-3.0 combination on modern MAC OSX.

I have success to run Quisk versions 3.7.8, 4.0.0, 4.0.3 on MacBook Pro with MAC OS X El Capitan installed using portaudio interface (pulseaudio can be left as-is, can be totally disabled in Quisk source code).

After lot of spent time the solution was next:

1. I removed Homebrew and switched port management to macports,
2. installed python 2.7 (python27) and (py27-wxpython-2.8) ports + all additional needed ports to run Quisk like portaudio, pulse audio, fftw3 etc.

Please pay attention that I have no any success to use python 2.7 with wxpython-3.0 , when used Homebrew package manager I had described in the beginning of this topic problem.

When switched to macports - Quisk exited with error message located inside wxpython package's functions.

If someone has more detailed question I will be glad to help.

73!
Alex

Hi Alex,

I would love to be able to run Quisk 4 on El Capitan.

Do you have an easy process to build it. I am using a Macbook Pro 4 core I7 and always failed to build properly. I can run on windows or linux in a VM (Parallels 10), but I would love to use the native version for quick.

I use Macports and Xcode for development work. I will have to get wxpython 2.8 as currently I use wxpythin 3 for KiCAD.

Please let me know the best way from scratch (dependancies).

Alex,

I'm a bit confused. Do you have it working now? Your commented that you had an error message...

"When switched to macports - Quisk exited with error message located inside wxpython package's functions."

If you used "make macports" then do this...
-"sudo port select python" then make sure your macports python version is selected. Mine is "python27"
-cd back to quisk build director and run by typing "python quisk". Just running ./quisk will always invoke the apple version due to the script header.

If it is working, then disregard.

Again, I would like to make a macports port of quisk so that all this is taken care of automatically. I should have more time in a couple weeks when work slows down.

Jean-Paul,
In connection to easier process - I have no any influence to policy of Apple, MAC OS X, Quiskand macports, so personally me cannot, make anything related to "make it easier".
Me self was the single voice in the desert asking for the help to make Quisk working under MAC OS X.

So I can only publish results of my own researches in this area and share with you have I got it working.
May be all my statements are wrong.

But finally I have Quisk working fine on MAC OS X El Capitan, using portaudio API and described to all the way I got this batch working together.

As well as i can understand macports policy -- it seam that you can install both wxpython-3.0 and wxpython-2.8

To install package I used next command:

port install py27-wxpython-2.8

2012. Re: [n2adr-sdr] Quisk on MAC OS X El Capitan (10.11)

Yahoo group: n2adr-sdr
Date: 2015-12-14 08:41:31 UTC
From: alex@...
Topic: 1974 Message: 2012

Eric,
Finally I get Quisk perfectly working on my MAC OS X El Capitan, no any error or warning messages.

I had to remove Homebrew and twice install and reinstall python, wxpython related packages multiple times to get it working, below I repeat my message I published on afedrisdr Yahoo group https://uk.groups.yahoo.com/neo/groups/afedrisdr/conversations/messages/3844, that give more detailed description how to get it working, for sure if you have different SDR than AFEDRI you can tootally ignore paragraph related to this hardware.

I want to publish here some information about possibility to use Quisk application http://james.ahlstrom.name/quisk/ on MAC computers running MAC OSX.
It is for experienced MAC OS users that know what is Terminal and command shell tools and how to compile executable from source code:

1. You should download Quisk package http://james.ahlstrom.name/quisk/from author's web page
2. Xcode SDK and command tools
3. Install macports https://www.macports.org to manage ports that required to be used with Quisk
4. You should install the next packages:
python27, py27-wxpython-2.8, fftw-3.0 , portaudio, pulseaudio and probably some additional
5. Be ready that packages installation will take long time. Select macports python as default python executable:
>> sudo port select --set python python27
6. After you will extract Quisk files from archive to separate directory you must enter Quisk directory and compile Quisk for your system running next command:

>> make macports
7. After installation to use Quisk with AFEDRi SDR, you have to download additional packages: afedriusb http://afedri-sdr.com/index.php/downloads/category/14-quisk-support?download=127:quisk-module-for-afedri-sdr-usb-connection , afedrinet http://afedri-sdr.com/index.php/downloads/category/14-quisk-support?download=128:quisk-module-for-afedri-sdr-net-network-connection extract contains of archive to separated folders afedriusb and afedrinet in main Quisk directory.
8. For network connected AFEDRI you must enter afedrinet folder and compile SDR support library running afe_library script, before you can run this script you must modify path to python library and include folders in this script, for example on my MAC it looks like:
##
gcc -o afedrinet_io.so --shared afedrinet_io.c ../is_key_down.c ../import_quisk_api.c -I"../" -I"/opt/local/Library/Frameworks/Python.framework/Versions/2.7/include/python2.7/" -L"/opt/local/Library/Frameworks/Python.framework/Versions/2.7/lib/" -lpython2.7
##
9. For USB connection you must download the sdr_commander v1.22 http://afedri-sdr.com/index.php/downloads/category/15-sdr-commander-command-shell-utility?download=233:sdr-commander

-v-1-22-command-shell-utility
Extract archive to separate folder and compile source code.
After successful compilation you will get executable sdr_commander, you must copy it to quick/afedriusb folder
10. Edit qusik_conf.py file to define correct sound device (card) name, copy this file as .quisk_conf.py to user's home directory.
For example for portaudio devices it will look like this one:

```
##################################################################################
from afedriusb import quisk_hardware sample_rate = 185185 name_of_sound_capt =
"portaudio#2" name_of_sound_play = "portaudiodefault" latency_millisecs = 150
default_rf_gain = 14 default_screen = 'WFall' playback_rate = 48000 default 48000
##################################################################################
```

Eric,
I forgot to add one note:
In present state Qusik 4.0.3 allows to choose portaudio devices only using "old" .quisk_config.py method.
There is no possibility to choose it (or even see it) directly from "ConfigFileRadio"->Sound menu.

P.S. I very recommend to use portaudio - this allow to soundcard based SDR users to choose directly specific sound card.

Topic: 1974 Message: 2014

Hi Alex,

I do not use Homebrew, so for me using MacPorts was the way to go.
I followed your instruction, and the “make macports” completed with a few warnings:

```
Jean-Pauls-MacBook-Pro:quisk-4.0.3 jean-paullouis$ make macports
env ARCHFLAGS="-arch x86_64" python setup.py build_ext --force --inplace -D USE_MACPORTS
running build_ext

Topic: 1974 Message: 2015

Jean-Paul,

We spoke at a Wilmington VHF club a couple months back. Welcome!

The compiler warnings are normal and appear with OSX clang. It seems it is more particular in syntax than gcc, but just ignore them for now. It’s on my list to look at.

The thing that looks wrong is here.

> File "/opt/local/Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages/wx-3.0-osx_cocoa/wx/_gdi.py", line 3914, in DrawLines

Make sure you have py27-wxpython-2.8 installed. Check by using “port installed”.

Jean-Paul,
The warnings are OK, but error when you are start pyhton qusik.py - exactly same as I got when used wxpython-3.0.

So I fully support Eric's advcie to you - it seams you have to install:
port install py2-wxpython-2.8

Pleas pay attention that it is the main information I got in fist message when reported about final success in the "struggle" with Quisk on MAC OSX

Hello Alex,

Although the PortAudio devices do not appear on the new Sound menu, they may be typed in directly and should work fine.

Jim,
I know that I can choose portaudio using .quisk_conf.py file - it is exactly what I am doing and it is working perfectly. But as I understend I cannot use your nice new fetures like ConfigFileRadio in the case I will use old good method? May be I am wrong.

My notes about portaudio was addressed to Eric, as I understood he is looking for the ways how to better integrate Quisk with MAC OSX.

By the way I am sure - pulseaudio it is not the best way to implement audio (on any OS) and portaudio is much better multiplatform alternative. For sure it is only my opinion

Hi Alex and Eric,

I could not install py27-wxpython-2.8 until I uninstalled gnu radio with install wxpython-3.0

Now I am installing py27-wxpython-2.8, and will let you know the progress.

py27-wxpython-2.8 is forcing install of a lot of stuff that was not loaded by py27-wxpython-3.0.

---> Computing dependencies for py27-wxpython-2.8
---> Dependencies to be installed: py27-numeric wxgtk-2.8 libGLU libsdl_mixer libmikmod smpeg

OK,
That worked! I have still a few warnings, but at least I got the QUISK Window when I typed:

Jean-Pauls-MacBook-Pro:quisk-4.0.3 jean-paullouis$ python quisk.py
W: [] caps.c: Normally all extra capabilities would be dropped now, but that's impossible because PulseAudio was built without capabilities support.

I had to update Quartz (my X11), but now I can proceed to the next step.

Thanks a lot guys.

Eric,
I'll keep you posted locally as I am sure I will catch you on the local repeaters, or the next local VHF meeting.

Jim,

I agree strongly with Eric and Alex. Portaudio is a lot better platform on OS X. I have not tried it on Linux or Windows as I try to stick with OS X

Regardless, you have done a good job with quick, thanks a lot for that.

I’m actually using pulseaudio as it allows me to use my softrock remotely over wifi. The IQ audio is streamed at 96khz rate and 16bit resolution. I’ve not tried port audio, but have been extremely pleased with pulse on OSX.

Eric

We glad to introduce new beta version of Zeus Radio!
Now, ExtIO interface is supported and ZR works with

Transceivers:
ZS-1

Hermes
ANAN
HiQSDR
Oddyssey
Receivers:

Peaberry
Afedri
RTL_2832
Winradio Excalibur & Pro
Perseus
SDR-IQ
Elad
etc.

Hi Yan,

I tried it on two PCs with an RTL2832 dongle plugged into a USB 2.0 port, ZeusRadio will not start on either, displaying the "Device not found Please, check USB connection" message. One PC is running XP SP3 and the other Win 8.1, and the same dongle will work with other SDR apps on both machines. The dongle shows up correctly in Device Manager.

Bob, you should run ZeusRadio.exe with parameters extio. That is all what you need.

unzip archive to any location on your PC and next you should re-create shortcut for ZeusRadio.exe.
Command line args for ZR:
hermes - launch ZR with Hermes protocol based transceivers
hiqsdr - launch ZR with HiQSDR protocol based transceivers
oddyssey - launch ZR with Odyssey protocol based transceivers
extio - launch ZR with ExtIO interface based receivers
dcc - DC correction (if needed)
waterfall=off - Turn off waterfall for old PC

Example launch extio with DC correction
"C:\Program Files\Zeus Radio\ZeusRadio.exe" extio dcc

The next step is DLL selection which implements ExtIO interface for your hardware.
I will try to answer all your questions.

Best Regards, Yan Alexeenko.

Yan -

Thanks, that did allow me to get to the next step of DLL selection but I don't see anything that looks like it's for the RTL dongle. I tried opening all of them but the window just blinked and came right back to the ExtIO library list.

I used ExtIO for about an hour 3 or 4 years ago so I'll admit I'm not familiar with it, but shouldn't there be something relative to "rtl32832" in the list? A few seem to be soundcard-related (such as OggVorbisCodec) - but I don't see anything that looks like SDR hardware in the list.

No luck with RTL dongle but ZeusRadio is working nicely with my
Hermes-Lite. I'm not sure the gain control is working right since the
S meter is pinned even though the spectrum display doesn't indicate that
the ADC is overloaded.

I've found some neat features by trial and error but documentation would
be helpful as I still haven't figured out what some controls do.
Overall it looks good!

> Zadig program?

Yes, as I said I can run the same RTL dongle using SDR# and it shows up as a WinUSB device in Device Manager.

The problem is there is no ExtIO dll in the standard Osmocom rtl-sdr download, nor in your package as far as I can see. Other programs seem to use ExtIOs from other sources, such as this one for HDSDR: https://github.com/josemariaaraujo/ExtIO_RTL

After I launch ZeusRadio extio, here is a list of the files in the ExtIO Library folder that is opened for me to choose from - which of these is the correct one for RTL2832 dongles? (You will see that I manually added rtlsdr.dll to the folder).

Thanks and 73,
Bob W9RAN

Topic: 2022 Message: 2031

Bob, it's look incorrect. You should download or compile 32 bit version ExtIO_RTL.dll from https://github.com/josemariaaraujo/ExtIO_RTL and put to ZR folder.

Download ExtIO_RTL-master, unzip and copy ExtIO_RTL-master\Release\ExtIO_RTL.dll to ZR folder

Please, look at this short video for starting ZR
http://screencast.com/t/ZWcqzJy1J

P.S. please, download latest beta version of Zeus Radio
https://drive.google.com/open?id=0Bylg7ZUFCyArcERwd0l4OGItYjA

Best Regards, Yan Alexeenko.

2035. How to access the Quisk Buttons remotely?

Yahoo group: n2adr-sdr
Date: 2016-01-26 22:45:34 UTC
From: peter@...
Topic: 2035 Message: 2035

Hi,

I'm in the process of building a new VHF transceiver. It will be a Heterodyne principle, using the HiQSDR board and Quisk for (de)modulation on 10.7 MHz, ie a Pandapter. The up- and down mixing will be done using a very low Phase Noise DDS (which I will have to control remotely as well, but that can be done in C-code, which I understand much better than OOP Python!). So far so goodfull. However, in order to make Quisk remotely controllable and featured for internet application, I try to convey the least amount of data as acquired at the remote location and transfer it to my local destination. The UDP sockets I've incorporated into the Quisk Software (version: 3.6.19) work fine and I've succeeded to send the Graphical data across, using 1 Byte per data point instead of 4 (at 0.5 dB resolution). What partially fails though is how to address the Buttons Remotely. To be more specific: How can I trigger the Graph, Waterfall, NB and AGC buttons, so they'll Show up as being pressed remotely? (I did manage to succeed with Mode and Bandwidth, but that must have been beginners luck. I'm a newbie on Python :-( ).

For example, the Noise Blanker seems to be defined as OnBtnNB(event). But how to trigger the "event" remotely so the button will be executed?? Any hints and clues are very much appreciated!

73s,

Peter, PA3BIY

Hi all,

As there was no reply whatsoever on my request regarding the (remote) control of Buttons, I went for the "dirty solution": I've decoded the mouse positions "locally", and run pyautogui to execute position movements and Mouse Clicks at the remote locations (At the local instance of Quisk the Button functions are decoded and send over internet. At recepit at the remote location these Buttons are executed as Mouse Positions and Clicks). It involved a lot of "globals", which is not "pythonic", but at least it got things working!

73s,

Peter

2037. WWV decode time

Yahoo group: n2adr-sdr
Date: 2016-02-08 18:01:00 UTC
From: MIKE DURKIN
Topic: 2037 Message: 2037

Does anyone set their computer time when no internet is available to WWV using Quisk's audio output (digital button) ?

The RTC on the Odroid arm computers last about a whole 1hr ... not nearly long enuff to be usable for portable use ....

Hi Mike,

here in Germany we have the DCF77 time signal transmitter close to Frankfurt which can be received in Germany and around. It transmits on 77.5kHz and can easily be received. Therefore this is the most common way to set a clock without internet reception beside using a GPS receiver. But since GPS receiver are so cheap it gets more and more common to synchronize such micro PC via GPS. Alternatively you can hook up a RTC to the I2C port of your Odroid.

regards
Mario, DH5YM

It may be cheap to use a gps ....

I'm out of ports .... besides I'm sure all is needed to implement it is already available

Iv found reference to what's called driver 36 which is more slated to wwvh and wwvb

2040. quisk_conf.py file for Raspberry Pi2 install

Yahoo group: n2adr-sdr
Date: 2016-02-12 02:55:00 UTC
From: radioguy90@...
Topic: 2040 Message: 2040

I am a newbie to the Pi2 and quisk --and am the point of yelling "uncle". Thanks to a lot of hand holding from Mike Durklin, I have managed to get quisk on a Pi2. I am posting my question here since it would have a wider audience.

Basically in the quisk directory and using the command python quisk.py I am able to get the display and see all of the numbers changing. I am using three sound cards --two external and the internal for the radio speaker. The softrock will be the ensemble. I have tried building a custom quisk_conf.py file and that typically results in a disaster such as you don't have permission to change the USB -- (I did make the local rules permission) Other error messages say can't find the hardware usb file module and on and on. Most of the time it locks up the screen.

Right now there is nothing in the quisk_conf.py file as I have given up on trying to cut and paste pieces. All I want to do is operate the ensemble and just need to see what a generic file should look like. I also note that the PTT button on the panel is white so I have no clue how to turn on the transmitter. I am assuming that the quisk_conf.py file must have pieces that say use USB, and the hardware is the ensemble. I did create a my_hardware file and that blew chunks too with a can't find a my_.hardware module.

I also tried i2cdetect and the panel shows nothing connected -- so another issue.

I have photos of the various panels and can share outside of this reflector if that would help in coming up with the solution, My email is n6qwham@gmail.com.

Getting the ensemble to work on PowerSDR was not easy and I find quisk to be more intuitive save for not being able to build a quisk_conf.py file

Thanks in advance.
Pete N6QW

Pete - I'm running Quisk on my RPi2 and would be happy to send you a copy of my config file on Friday morning if you are still interested. I have only two sound cards - the one built into the RPi2 which I use only to play back my audio for listening, and an external Tascam US-125M. But it does work, and I've used this configuration to make CW contacts, in addition to using the Ensemble RXTX for a WSPR station on 20 and 40 meters.

Did you overclock the Pi2 ?

Iv been wondering why Pete's isnt working .. and why using a quisk_conf.py file.

Though the new version 4 can use it .. we were moving to a gui setup ...

Im using a quisk_conf.py too ... i have a few more buttons ... all the way up to 70cm

Hi Jim,

That would be great – I can sort out the 2 versus 3 sound cards. Also am interested in anything about PTT.

Thanks in advance.

Pete

Hi Mike,

The only reason I put in the quisk_conf.py file was the instructions and that I wasn't seeing any I2C. Just not sure what all needs to be "in or out". I am running 4.0.3

the ptt is not an external connection. i do believe that it is part of the communication with the AVR.

If you can change frequency’s and usbsoftrock also concurs the change than it should also switch to Tx.

You might need to overclock your Rp2 some ....

I dont know ...

for Raspberry Pi2 install

Pete - I'm running Quisk on my RPi2 and would be happy to send you a copy
of my config file on Friday morning if you are still interested. I have only
two sound cards - the one built into the RPi2 which I use only to play back my
audio for listening, and an external Tascam US-125M. But it does work, and
I've used this configuration to make CW contacts, in addition to using the
Ensemble RXTX for a WSPR station on 20 and 40 meters.

I am a newbie to the Pi2 and quisk --and am
the point of yelling "uncle". Thanks to a lot of hand holding from Mike
Durklin, I have managed to get quisk on a Pi2. I am posting my question here
since it would have a wider audience.

Basically in the quisk directory and
using the command python quisk.py I am able to get the display and see all
of the numbers changing. I am using three sound cards --two external and the
internal for the radio speaker. The softrock will be the ensemble. I have
tried building a custom quisk_conf.py file and that typically results in a
disaster such as you don't have permission to change the USB -- (I did make
the local rules permission) Other error messages say can't find the hardware
usb file module and on and on. Most of the time it locks up the screen.

Right now there is nothing in the
quisk_conf.py file as I have given up on trying to cut and paste
pieces. All I want to do is operate the ensemble and just need to see what a
generic file should look like. I also note that the PTT button on the panel
is white so I have no clue how to turn on the transmitter. I am assuming
that the quisk_conf.py file must have pieces that say use USB, and the
hardware is the ensemble. I did create a my_hardware file and that blew
chunks too with a can't find a my_.hardware
module.

I also tried i2cdetect and the
panel shows nothing connected -- so another
issue.

I have photos of the various
panels and can share outside of this reflector if that would help in coming
up with the solution, My email is n6qwham@....

Getting
the ensemble to work on PowerSDR was not easy and I find quisk to be more
intuitive save for not being able to build a quisk_conf.py
file

Thanks in
advance.

Hi Mike,

When all else fails read the instructions --- in the help file on 4.0.3 –it says folks got tired of changing the config file –so now it is all done with the gui.

My question about the PTT was that it is white lettering versus black like on the active buttons –and the active buttons depress (visually it looks that way).

The raspi config file lets you overclock but that also means adding a heat sink –so as soon as I get the heatsink I will do that. Seems to update ok as is. I will check the cpu loading and see what that says.

the ptt is not an external connection. i do believe that it is part of the communication with the AVR.

If you can change frequency’s and usbsoftrock also concurs the change than it should also switch to Tx.

You might need to overclock your Rp2 some ....

Hi Jim,

I am running 4.0.3 and perhaps as Mike suggested the file is not needed –the display and buttons seem to work all except for the PTT. It is not connected to the radio other than the control board to the softrock and there is no register of an I2C showing up.

Pete - you still need assistance?

I just did some fiddling with my RXTX and Quick this morning. Seems that the PTT thing only operates if you are NOT in CW-L or CW-U. On my version, when I'm in CW-L pressing the PTT button only makes it turn red and the radio does not go into transmit mode. If I go into USB-U or USB-L and press PTT, the radio does in fact go into transmit mode.

2053. Re: [n2adr-sdr] quisk_conf.py file for Raspberry Pi2 install

Yahoo group: n2adr-sdr
Date: 2016-02-12 17:33:53 UTC
From: RadiosRUs
Topic: 2040 Message: 2053

More Info.

I ran a test by loading Hermes on to my quisk and the PTT button shows up on the display and turns red. I found the code in Hermes that does the OnButton but I do not see any similar code in the softrock ensemble main coded or in the widget code. I tried adding that code to the widget –but nothing happened –I think having the PTT show up black is necessary.

Any clues would be most appreciated.

Hi Mike,

When all else fails read the instructions --- in the help file on 4.0.3 –it says folks got tired of changing the config file –so now it is all done with the gui.

My question about the PTT was that it is white lettering versus black like on the active buttons –and the active buttons depress (visually it looks that way).

The raspi config file lets you overclock but that also means adding a heat sink –so as soon as I get the heatsink I will do that. Seems to update ok as is. I will check the cpu loading and see what that says.

Hi Jim,

I am running 4.0.3 and perhaps as Mike suggested the file is not needed –the display and buttons seem to work all except for the PTT. It is not connected to the radio other than the control board to the softrock and there is no register of an I2C showing up.

Pete - I'm running Quisk on my RPi2 and would be happy to send you a copy of my config file on Friday morning if you are still interested. I have only two sound cards - the one built into the RPi2 which I use only to play back my audio for listening, and an external Tascam US-125M. But it does work, and I've used this configuration to make CW contacts, in addition to using the Ensemble RXTX for a WSPR station on 20 and 40 meters.

Pete - do you have a key or paddle to connect to your RXTX? If so, does it transmit CW when you key it?

What happens to the PTT when you put Quisk into USB-L or USB-U? Does the PTT do anything then?

Hi Jim,

Yes – it is still a problem – The PTT works as you describe if Hermes is loaded on the quisk but not the softrock ensemble. It was in SSB and not CW when I checked the PTT – I am running 4.0.3 and I think you might be using an earlier version.

Subject: Re: [n2adr-sdr] quisk_conf.py file for Raspberry Pi2 install

Pete - you still need assistance?

I just did some fiddling with my RXTX and Quick this morning. Seems that the PTT thing only operates if you are NOT in CW-L or CW-U. On my version, when I'm in CW-L pressing the PTT button only makes it turn red and the radio does not go into transmit mode. If I go into USB-U or USB-L and press PTT, the radio does in fact go into transmit mode.

Hi Jim,

I do not have a key or paddle so can't check that – Quisk in USB or LSB with the softrock ensemble –PTT does not work. With Hermes loaded on the quisk the PTT does work. There is code in the Hermes to detect the PTT but that same code seems missing with the softrock ensemble.

ensemble –PTT does not work. With Hermes loaded on the quisk the PTT does work. There is code in the Hermes to detect the PTT but that same code seems missing with the softrock ensemble.

From: RadiosRUs
Topic: 2040 Message: 2058

Hi Jim,

Thank you –but that didn't work – however I did load hardware_usb and aside from two error messages about a fredv file not being false and that I didn't have permission to access the usb interface – the PTT and vox work – but no display.

I just wished there was a better bread crumb trail so those of us who don't know could know.

Thanks you for taking the time to copy the file and answering my question – one thing I might do is make another directory with 3.7.7 and see if I can get that to work and then I would have a better idea of the fix. Then I could use the file you sent me.

Hi Mike,

When all else fails read the instructions --- in the help file on 4.0.3 –it says folks got tired of changing the config file –so now it is all done with the gui.

My question about the PTT was that it is white lettering versus black like on the active buttons –and the active buttons depress (visually it looks that way).

The raspi config file lets you overclock but that also means adding a heat sink –so as soon as I get the heatsink I will do that. Seems to update ok as is. I will check the cpu loading and see what that says.

Pete - sounds like you are getting closer and sorry my config file didn't resolve it. It took me a lot of f@rting around to get it working in the RPi and because of that I've been reluctant to try upgrading to v4. Guess I could build a new folder for v4 and give it a try. I'd sure be pissed though if it messed up my working v3.7.7... ☐

2060. Now Workingh [n2adr-sdr] quisk_conf.py file for Raspberry Pi2 install

Yahoo group: n2adr-sdr
Date: 2016-02-13 03:33:59 UTC
From: RadiosRUs
Topic: 2040 Message: 2060

Hi Jim,

Ethan (KB8OJH.net) on his website had a slightly different line for USB permission

sudo nano /etc/udev/rules.d/99-softrock.rules and then the standard info SUBSYSTEM==”usb” ... That worked and the hardware is hardware_usb. You do not need anything in the config file. The freedv message was fixed in the control panel under the control tab. When you hit PTT the Rx mutes and the button turns red.
This is now getting exciting. So 4.0.3 works.
Thanks for you help.

Subject: Re: [n2adr-sdr] quisk_conf.py file for Raspberry Pi2 install

Pete - sounds like you are getting closer and sorry my config file didn't resolve it. It took me a lot of f@rting around to get it working in the RPi and because of that I've been reluctant to try upgrading to v4. Guess I could build a new folder for v4 and give it a try. I'd sure be pissed though if it messed up my working v3.7.7... ☐

On Feb 12, 2016, at 18:25, 'RadiosRUs' radioguy90@... [n2adr-sdr] <n2adr-sdr@yahoogroups.com> wrote:

Hi Jim,

Thank you –but that didn’t work – however I did load hardware_usb and aside from two error messages about a fredv file not being false and that I didn’t have permission to access the usb interface – the PTT and vox work – but no display.

I just wished there was a better bread crumb trail so those of us who don’t know could know.

Thanks you for taking the time to copy the file and answering my question – one thing I might do is make another directory with 3.7.7 and see if I can get that to work and then I would have a better idea of the fix. Then I could use the file you sent me.

Subject: Re: [n2adr-sdr] quisk_conf.py file for Raspberry Pi2 install

Pete - here is a copy/paste of my quick_conf.py file. Not a lot specific to PTT, but maybe you can see something that might make yours work. Keep in mind I am using version 3.7.7 and not V4.

Jim / W6JHB

Hi Mike,

When all else fails read the instructions --- in the help file on 4.0.3 –it says folks got tired of changing the config file –so now it is all done with the gui.

My question about the PTT was that it is white lettering versus black like on the active buttons –and the active buttons depress (visually it looks that way).

The raspi config file lets you overclock but that also means adding a heat sink –so as soon as I get the heatsink I will do that. Seems to update ok as is. I will check the cpu loading and see what that says.

install

Pete - sounds like you are getting closer and sorry my config file didn't resolve it. It took me a lot of f@rting around to get it working in the RPi and because of that I've been reluctant to try upgrading to v4. Guess I could build a new folder for v4 and give it a try. I'd sure be pissed though if it messed up my working v3.7.7... ☐

Hi Jim,

Thank you –but that didn’t work – however I did load hardware_usb and aside from two error messages about a fredv file not being false and that I didn’t have permission to access the usb interface – the PTT and vox work – but no display.

I just wished there was a better bread crumb trail so those of us who don’t know could know.

Thanks you for taking the time to copy the file and answering my question – one thing I might do is make another directory with 3.7.7 and see if I can get that to work and then I would have a better idea of the fix. Then I could use the file you sent me.

Pete - here is a copy/paste of my quick_conf.py file. Not a lot specific to PTT, but maybe you can see something that might make yours work. Keep in mind I am using version 3.7.7 and not V4.

Jim / W6JHB

Pete - do you have a key or paddle to connect
to your RXTX? If so, does it transmit CW when you key it?

What happens to the PTT when you put Quisk into USB-L or USB-U? Does
the PTT do anything then?

More Info.

I ran a test by loading Hermes on to my quisk and the PTT button
shows up on the display and turns red. I found the code in Hermes that
does the OnButton but I do not see any similar code in the softrock
ensemble main coded or in the widget code. I tried adding that code to the
widget –but nothing happened –I think having the PTT show up black is
necessary.

Any clues would be most appreciated.

Hi Mike,

When all else fails read the instructions --- in the help file on 4.0.3 –it says folks got tired of changing the config file –so now it is all done with the gui.

My question about the PTT was that it is white lettering versus black like on the active buttons –and the active buttons depress (visually it looks that way).

The raspi config file lets you overclock but that also means adding a heat sink –so as soon as I get the heatsink I will do that. Seems to update ok as is. I will check the cpu loading and see what that says.

the ptt is not an external connection. i do believe that it is part of the communication with the AVR.

If you can change
frequency’s and usbsoftrock also concurs the change than it should also switch to Tx.

You might need to overclock your Rp2 some
....

I dont know ...

Hi Jim,

I am running 4.0.3 and perhaps as Mike suggested the file is not needed –the display and buttons seem to work all except for the PTT. It is not connected to the radio other than the control board to the softrock and there is no register of an I2C showing up.

Yes, I did over clock it but not full blown AA Fuel Dragster though,
just a mild over clock. I am not yet using V4 Quisk.

Pete - I'm running Quisk on my RPi2 and would be happy to send you
a copy of my config file on Friday morning if you are still interested.
I have only two sound cards - the one built into the RPi2 which I use
only to play back my audio for listening, and an external Tascam
US-125M. But it does work, and I've used this configuration to make CW
contacts, in addition to using the Ensemble RXTX for a WSPR station on
20 and 40 meters.

wrote:

I am a newbie to the Pi2 and quisk
--and am the point of yelling "uncle". Thanks to a lot of hand holding
from Mike Durklin, I have managed to get quisk on a Pi2. I am posting
my question here since it would have a wider audience.

Basically
in the quisk directory and using the command python quisk.py I am able to get the display and see all of the numbers changing. I am using three sound cards --two external and the internal for the radio speaker. The softrock will be the ensemble. I have tried building a custom quisk_conf.py file and that typically results in a disaster such as you don't have permission to change the USB -- (I did make the local rules permission) Other error messages say can't find the hardware usb file module and on and on. Most of the time it locks up the screen.

Right
now there is nothing in the quisk_conf.py file as I have given up on trying to cut and paste pieces. All I want to do is operate the ensemble and just need to see what a generic file should look like. I also note that the PTT button on the panel is white so I have no clue how to turn on the transmitter. I am assuming that the quisk_conf.py file must have pieces that say use USB, and the hardware is the ensemble. I did create a my_hardware file and that blew chunks too with a can't find a my_.hardware
module.

I also tried i2cdetect
and the panel shows nothing connected -- so another
issue.

I have photos of the
various panels and can share outside of this reflector if that would help in coming up with the solution, My email is n6qwham@gmail.com.

Getting
the ensemble to work on PowerSDR was not easy and I find quisk to be more intuitive save for not being able to build a quisk_conf.py
file

Thanks in
advance.

Topic: 2040 Message: 2062

This is turning out to be quite a saga.
Even I who collaborated with N2ADR to get Softrock supported on Linux
all those years ago am confused by this runaway thread.

I don't have any Softrock gear on the desk right now but I have run
Softrock v6.3 + Mobo v3.6, SR63ng +Mobo v4.3.4 + SDR-Widget, RXTX,
UHFSDR+ SDR-Widget and now HiQSDR and Hermes-Lite.

Apart from an initial misunderstanding when setting the multiplier for
UHFSDR, there has never been a single hiccup.
SUBSYSTEM=="usb", ACTION=="add", ATTR{idVendor}=="16c0",
ATTR{idProduct}=="05dc", MODE="0666", GROUP="dialout"
73 ... Sid.

Hi All,

I have just upgraded to new firmware 1.4 and installed last version of quisk
All seems to run ok however, cluster dosent work. I have used the same setting as on a different computer
but still i have some error. Anyone that can explain ?. see attached picture:

Hi Rune,

I wonder if you are using a log program like CQRLog which is using the same cluster details as you have provided for Quisk. This would cause a clash and stop the Quisk cluster working.

Hi Rune.
Have you got a port number set.
Just tried on my machine and in the quisk_conf.py my settings are:-

```
dxClHost = 'la7q.ddns.net'
dxClPort = 9000 # port number for telnet
user_call_sign = 'f1vkk' # your radio station call sign; probably
needed for telnet login
dxClPassword = '' # telnet password
```

Hi Graeme

Yes i do use another software with cluster function and same address etc, HRD logbook. I have closed the the logbook and even sett different addressin HRD logbook and also tryed different address in Quisk but no luck so far.

Hi Rune.
The Callsign for DX cluster should be la7tha (your callsign not la7q)
And Password for DX cluster should be blank remove la7tha

just for old times I remember you building your Mobo Kit while Maritime Mobile.
Are you still sailing the high seas.

2069. Rotary Encoder on Raspberry PI 2 and Quisk

Yahoo group: n2adr-sdr
Date: 2016-02-15 19:31:06 UTC
From: dan.tiganas@...
Topic: 2069 Message: 2069

Hi all,
I am building a standalone transceiver using Raspberry PI 2 + Quisk + Softrock RXTX. Everything works very well. I added some commands in Quisk hardware_usb.py to command PTT and Band Select for the QRO amplifier via GPIO pins.
However, now I am stuck in trying to add a rotary encoder in Quisk. The encoder is connected to GPIO pins. I've managed to change the frequency using the encoder, but the GUI gets stucked and crashes with the error "Fatal IO error 11 (Resource temporarily unavailable) on X server :1.0". This is well beyond my Python knowledge (which is very basic anyway).
I am using the rotary python library from here: Raspberry PI Rotary Encoder Source Code
Maybe somebody can give me a hint of what should I do next, I am totally lost for now...Appreciate your help, thanks, 73!

PS: I've changed the quisk.py as follows (changes in red).

```

Hi Peter,

Thanks, yes the "la7q" i know was wrong i just forgot to change it. No password seems to sort out the problem. Thanks for the help. Still working for the same company but working in the office. My last trip was three years ago after 15 years offshore. My Mobo is still in a box and running :-)

Do the quisk software support the ANT1 /ANT2 function fully, i can hear relay that is activated when i switch between ant1/ant2 but if i try to use one of the other ports for "second antenna / RX antenna" no RX is opserved.I cant remember this.

From: runeegil@...
Topic: 2071 Message: 2071

Hi All,

I wonder

When i select Antenna 1 in software, that is the one used as main antenna
lower left sma connector in picture. This is used as TX and RX antenna.

When selecting antenna 2 is that the other two sma connector / top left in picture below.

See also copy and paste on scematics below.

However, if i sellect antenna 2 and connect my antenna to one or the othere top left in picture i get nothing.

Is there any other settings that is needed in the conf.py file or any soldering bridge that is needed and i have forgotten.

I would like to use one antenna port for RX only antenna.

Hello,

Quisk runs with two threads, a sound thread and a GUI thread. The callback function EncTune() is called by another thread supplied by the OS, and this interferes with the GUI thread.

To fix this, it is easiest to write new code in your hardware file. Create a hardware file if you don't have one and add some code:

```
from rotary_class import RotaryEncoder

class Hardware:
def __init__(self, app, conf):
# Keep track of the current tune frequency and VFO
self.tune_freq = 0
self.vfo_freq = 0
etc........

def open(self):

# Make a rotary control when opening the hardware
self.rswitch = RotaryEncoder(PIN_A, PIN_B, BUTTON, self.EncTune)
etc......

def ChangeFrequency(self, tune, vfo, source='', band='', event=None):
# When Quisk changes the frequency, record the new frequency
self.tune_freq = tune
self.vfo_freq = vfo
etc......

def ReturnFrequency(self):

# When Quisk asks for the current frequency, return it
return self.tune_freq, self.vfo_freq

def EncTune(self, event)
# When the control changes the frequency, adjust it
if event == RotaryEncoder.CLOCKWISE:
self.tune_freq += 100
elif event == RotaryEncoder.ANTICLOCKWISE:
self.tune_freq -= 100
```

This is untested code, but something like this should work.

Hi Jim,
Thank you so much!!!!! It really works perfectly!!
I've changed my hardware_usb.py file from Softrock folder, that is the one
I am using.
Just a short note, I had to change a little bit ReturnFrequency(self):
because initially self.tune_freq is null, therefore Quisk starts @0 Hz. I
also added some code so I can use mouse_wheelmod config variable as tune
step for the encoder.
I've attached the diff file which include also PTT and Band commands.
Thanks again, really great job you're doing!!!!!
I am sooo happy!!! :-D

Updates. I discovered that there was a bug when Restarting Quisk from Config menu, because the rotary class initiate an event callback to detect if there is a change on GPIO pins, but that event is not deleted at restart. Therefore I modified rotary_class.py to add an event_removal definition that will delete the running GPIO threads, then I modified hardware_usb.py to call event_removal on Close Hardware definition.
Attached both diff files.

2076. New package for custom hardware

Yahoo group: n2adr-sdr
Date: 2016-02-19 20:39:10 UTC
From: frspin@...
Topic: 2076 Message: 2076

I am trying to make a interface (RX only) to SoapySDR library. This libray is able to talk to different hardware.

I am not a C programmer but, as far as know, Quisk is able to read from a sound card and from an UDP stream (only for selected hardware). For reading from another libray I need a C module defining Open and Close for Python and Start Stop and Read (in C).

SoapySDR library have a C++ API, a C API and a Python API but, if i have read correctly Quisk documentation, I can't mix this API and I need to define function callable from Python in C extension module.

Is this correct or there is another mode for do this interface?
There is someone working on this library or in a similar library?

2077. Quisk/Fldigi on the Raspberry Pi 2

Yahoo group: n2adr-sdr
Date: 2016-02-24 00:21:08 UTC
From: n7ihq.jim@...
Topic: 2077 Message: 2077

I have been evaluating the performance of Quisk and Fldigi on my Raspberry Pi 2 running Ubuntu MATE 15.10. The Quisk small screen button layout is ideal on my 5 inch 800x480 LCD display.

I connected Fldigi to Quisk using the ALSA loopback module. The audio stream was intermittent using the default hardware poll timing. After increasing the hardware poll interval from 5000 to 20000 usecs, the audio was fine and the setup is quite useful.

I measured the CPU usage using the Linux pidstat command, included with the sysstat package. There are two Python and two Fldigi threads shared among the 4 CPU cores in the Raspberry Pi 2. In Setup 1, the Quisk audio output and digital output are running simultaneously. In Setup 2, Fldigi is connected to the audio output and the digital output is not used.

Setup 1:
Audio output to Pi DAC
Digital output to Fldigi
DGT-L mode
CPU Python threads: 52%, 54%
CPU Fldigi threads: 10%, 21%

Setup 2:
Audio output to Fldigi
Digital output unused
LSB mode
CPU Python threads: 54%, 18%
CPU Fldigi threads: 9%, 25%

Note that the total CPU usage is 31% higher using both audio and digital outputs. I suggest adding the option of muting the audio output in digital modes to reduce the CPU load.

73,

Jim

2078. Raspbian Jessie on Raspberry Pi 2

Yahoo group: n2adr-sdr
Date: 2016-02-24 08:01:31 UTC
From: Sid Boyce
Topic: 2077 Message: 2078

I am about to try the Ubuntu Mate 15.10 distro as I had a SD card corruption with Raspbian Wheezy and decided to install Jessie instead.

The raspi-config script assumes the only user to be "pi" which I deleted. Changing /etc/lightdm/lightdm.conf from autologin-user=pi to autologin-user=hiqsdr and running "dpkg-reconfigure lightdm" has no effect in Jessie - was OK in Wheezy.

For my Standalone HiQSDR I need to autologin as user hiqsdr and automatically start quisk but it steadfastly presents me with a LXDE login prompt which of course needs a keyboard.
Whatever I try from google posts results in no change.
73 ... Sid.

Hi Sid,
Why deleting user PI? You can change the password if you want but I think
it takes much less time to use pi user.

Hi Sid,
Try the following (worked for me)(I believe your user must have sudo
rights):

sudo nano /etc/inittab
Scroll down to the line :
1:2345:respawn:/sbin/getty 115200 tty1
and add a # character to the begining of the line to disable it :
#1:2345:respawn:/sbin/getty 115200 tty1
Under the line add the following :
1:2345:respawn:/bin/login -f [your_username] tty1 </dev/tty1 >/dev/tty1 2>&1

To load LXDE at startup edit /etc/profile
sudo nano /etc/profile
Scroll to the bottom and add the following line :
startx

To autostart apps on LXDE I am using the following:

nano /home/[your_username]/.config/lxsession/LXDE-pi/autostart

Optionally you can comment lxpanel, pcmanfm and xscreensaver, in that case
LXDE will start as a completely blank screen:

#@lxpanel --profile LXDE-pi
#@pcmanfm --desktop --profile LXDE-pi
#@xscreensaver -no-splash

Add your application (in this example quisk):
python /home/pi/quisk-4.0.3/quisk.py

Let me know if it works!

2082. Re: [n2adr-sdr] Raspbian Jessie on Raspberry Pi 2

Yahoo group: n2adr-sdr
Date: 2016-02-25 13:38:32 UTC
From: Sid Boyce
Topic: 2077 Message: 2082

Thanks Dan,
Tried all those dodges to no avail. My guess that there is something buried somewhere that prevents simple file alterations taking effect and "dkpg-reconfigure lightdm" didn't sort it either.

With Wheezy, there was no problem, altering /etc/inittab simply did the trick with ~/.bash_login starting X and quisk.
"1:2345:respawn:/bin/login -f hiqsdr tty1 </dev/tty1 >/dev/tty1 2>&1"

However Jessie uses systemd rather than sysvinit, same for Ubuntu Mate 15.10.

I also tried setting it up in /lib/systemd/system/autologin@.service in Jessie, nothing worked - it point blank refused to autologin either with pi before it was deleted or with user hiqsdr.

Ubuntu Mate15.10, no probs on that score - it boots up fully as user hiqsdr and automatically starts quisk.
/etc/lightdm/lightdm.conf set to autologin-user=hiqsdr and added an executable script (/usr/local/bin/QUISK) to Settings --> Startup Applications. All the bash script does is "cd /opt/quisk-4.0.4;python quisk.py".
73 ... Sid.

2083. Re: [n2adr-sdr] Raspbian Jessie on Raspberry Pi 2

Yahoo group: n2adr-sdr
Date: 2016-02-25 14:38:07 UTC
From: Daniel Tiganas
Topic: 2077 Message: 2083

That is odd indeed. For me it was very simple using raspi-config to configure autologin on LXDE using user PI and then start Quisk from there, on Raspian Jessie. Now I am running headless, using only the touch and the encoder to interact with the system. I don't understand why it didn't work "out of the box" with raspi-config for you. Maybe trying cooking a new Jessie image on SD?

From: Sid Boyce
Topic: 2077 Message: 2084

A complete mystery to me also.

If I get time I'll burn another microSD card and see if that works with just user pi.

Wheezy worked with users /home/pi and /home/hiqsdr which was the user I used to run quisk.
73 ... Sid.

2085. Quisk and OmniaSDR on RPi?

Yahoo group: n2adr-sdr
Date: 2016-02-28 04:15:39 UTC
From: w6jhb@...
Topic: 2085 Message: 2085

Anyone here been successful getting an OmniaSDR Basic (OSB) running with Quisk on a Raspberry Pi? I just finished (well, 99 percent finished) building a 60/40/30/20 meter Semi-DIY OSB. Works fine with HDSDR on Windows 8.1 except for not being able to use CW. I did manage one local QSO on 40 CW using Rocky on Windows 8.1 today. However, my goal is to use the OSB on my RPi2.

I currently have a SoftRock Ensemble RXTX that I use on my RPi2, occasionally with Quisk but most of the time in a 24-7 WSPR operation. This afternoon I unhooked the OSB from Windows, moved the USB cable over to my RPi2, rebooted it, and fired up Quisk, using the existing config file. No signals were seen on the Quisk display. I was hoping the existing config file would work as is, but looks like some changes are gonna be needed. The first thing needing a change will be the sampling rate, as my RXTX was using a Tascam US-125M external sound card at 48000 and the OSB runs 96000. Not sure what else I need to tweak

Anyway, wondering if anyone else has gotten their OSB running on an RPi and/or with Quisk....???

btw - I am not using the new v4 Quisk. Still have v3.x and wanted to get the OSB working on a working and familiar-to-me version of Quisk...

SoapySDR is a library for controlling many SDR hardware.

https://github.com/pothosware/SoapySDR/wiki https://github.com/pothosware/SoapySDR/wiki

Actually "audio SDR" (as in Quisk), Osmo, UHD, BladeRF, HackRF, RTL-SDR, SDRPlay and Red Pitaya, also remotely connected

I don't see listed a reference to any of the hardware that quisk
supports - which are
Softrock/UHFSDR/Peaberry and maybe OminaSDR if it's a clone of the
Peaberry, HiQSDR, Charleston, SDR-IQ and Hermes-Lite.

Quisk also interfaces to digital programs such as wspr which in any case
run natively under Linux and are not SDR programs.

To support, e.g RTL-SDR, Red Pitaya, etc. you'd have to write plugins
for quisk eliminating the need for any other SDR program.

SoapySDR seems to be another SDR program like quisk which also needs
plugins to support hardware other than what is current built-in.
73 ... Sid.

73 ... Sid.

SoapySDR is a library, not an SDR program. ANd don't have any built-in hardware support.

We can write a plugin for SDRPlay, another for RTL-SDR and so on.
Or a plugin for SoapySDR and get interface to SDRPlay, RTL-SDR and any other hardware, also remotely connected.
And SDRPlay maker is supporting an API and an interface to SoapySDR.

So!!! What would it require quisk, ghpsdr3-alex or any other program to
do - if e.g I am running a Softrock, HiQSDR or Hermes-Lite using quisk?

I built and installed it from source on x86_64 and ODROID-U3 with the
same results.
root@odroidu3:# SoapySDRUtil --info
##

Topic: 2076 Message: 2093

You have compiled SoapySDR, the "main" library.
Based on your hardware you need to compile module for this hardware (SoapyAudio for any device using a SoundCard, SoapySDRPlay for SDRPlay, HackRF library, SoapyRemote, etc,) and, when you are calling function in SoapySDR library from your program (quisk or any other) the library can search for any hardware present in your PC or in your LAN.
After this you can use this hardware with "neutral call" to SoapySDR library.

For this, if we can do a module for Quisk interfacing to SoapySDR, we can use from Quisk all of this different hardware with same config file.

OK Franco,
I see the the list of hardware supported out of the box in the FAQ, none of which I have or planning to have. It seems that if the SoapySDR library could be imported into quisk those additional devices would be supported.
I see the python module it installs
/usr/lib64/python3.4/site-packages/SoapySDR.py

From the FAQ

What devices are supported?
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Currently, most devices from gr-osmosdr are supported:

* bladerf
* hackrf
* rtl
* rfspace
* mirisdr

And devices from the UHD project:

* usrp
* umtrx
* myriadrf

These are just the devices we know about.

With current versions all the quisk supported hardware is GUI configured and written to ~/quisk_settings.json which makes it unnecessary to have separate ~/.quisk_conf.py files for the different SDR's.
Any instance of quisk can reach the rigs on the LAN.

Correct me if I still misunderstand what advantage SoapySDR would give me over using quisk native or quisk with plugins written for the rigs that SoapySDR supports. The documentation does not spell out how exactly it's used with gnuradio or any other software and I can't find any examples.
73 ... Sid.

From: frspin@...
Topic: 2076 Message: 2096

There is also SDRPlay in list, and you can see it on

https://github.com/pothosware/SoapySDR/wiki https://github.com/pothosware/SoapySDR/wiki
On right column there is a menu with "Modules" available

The utility for using SoapySDR library over a specific library is all in doing the work only one time.
Quisk can read samples from a small set of devices. For other devices a C module is needed. We can write a module for RTL-SDR and for SDRPlay but, if we can write a module for SoapySDR, all the work is done.
SoapySDR have a Python interface, if this can be used mixed to C interface.
And SoapySDR have also a remote interface.You can have hardware on a machine, running a SoapySDR server, and Quisk on another machine in LAN.

2097. Redpitaya and linux-Quisk4.0.4 -- Audio level

Yahoo group: n2adr-sdr
Date: 2016-03-02 20:48:37 UTC
From: michael.hartje@...
Topic: 2097 Message: 2097

Hello list,

I started using Red pitaya with pavel's openHPSDR-transceiver-FPGA-Code special realization as openHPSDR "Metis".
I use Quisk 4.0.4 GUI on linux to configure the ip-connection.
The start was very easy -- but the audio level is very very low. The max volume is even very low compared to softrock receivers.

Does anybody else observed this phaenomen?

What should I pay special attention for?

Where can I change the the gain inside the code for adjusting amplification for the "hermes" signals? -- should this be in the hermes -- or inside quisk?

Thanks

Michael

2098. Quisk V3 Default Power Setting?

Yahoo group: n2adr-sdr
Date: 2016-03-03 03:01:45 UTC
From: w6jhb@...
Topic: 2098 Message: 2098

I'm using version 3 of Quisk along with an OmniaSDR radio and all is working fine. Just wondering if there is a setting I can include in my config file so that at startup the power level is set to 40 percent instead of where it is now, at 70 percent.

Tnx, Jim / W6JHB

2099. Re: [n2adr-sdr] Redpitaya and linux-Quisk4.0.4 -- Audio level

Yahoo group: n2adr-sdr
Date: 2016-03-03 11:34:55 UTC
From: Sid Boyce
Topic: 2097 Message: 2099

The only low volume problem I have had recently is with a new
installation of Ubuntu 15.10 on a Raspberry Pi 2 in my standalone
HiQSDR. I just needed to run alsamixer and adjust the controls.
Quite often in Linux mixer settings are either very low or muted.

If it's not an audio mixer setting it must be low output from the Red
Pitaya compared to any other SDR which is highly doubtful. Someone would
have highlighted it already as Red Pitaya has been around for quite a
while.
Are you saying Softrock volume is fine?

Apart from the HiQSDR standalone I run quisk on any of 6 x86_64 boxes,
an ODROID-U3 and an ODROID-C1 to 2 Hermes-Lites.
73 ... Sid.

2100. Install of Quisk V4 Question

Yahoo group: n2adr-sdr
Date: 2016-03-03 17:18:33 UTC
From: w6jhb@...
Topic: 2100 Message: 2100

Will the installation of version 4 on a Raspberry Pi affect a currently installed version 3.7.7? The old version is working fine right now; I'd like to give V4 a spin, but not if it is going to hose my V3.

Comments, please.....

2101. RE: [n2adr-sdr] Install of Quisk V4 Question

Yahoo group: n2adr-sdr
Date: 2016-03-03 18:04:38 UTC
From: MIKE DURKIN
Topic: 2100 Message: 2101

shouldnt ....

as long as you dont unzip/compile in teh same folder as V3 .... youll just make a mess ....

Do you launch Quisk from terminal/script or have it in programs listing ... ?

If you normally use a script or from terminal it should not cause any issues .... i have a few versions built and i dont remember any interaction ....

V4 can even read your old conf radio file ... and when when you make a new definition radio file with V4 .. it will not change your old conf file but make a new one that has a diferent format (and in a different folder too)

So you might be able to use a transverter with out makeing a new config file -- not sure. might also save the transverter settings in the new radio configure file ... dont know .. iv not had the need.

Thanks Mike - I'll be sure it goes into a separate folder and not get mixed in with my 3.7.7 stuff. I launch Quisk from a terminal session if I need to see console output, otherwise for routing operation of it I use a script I built.

But.... transverter...eh? Ya lost me on that one.

Thanks Mike - I'll be sure it goes into a separate folder and not get mixed in with my 3.7.7 stuff. I launch Quisk from a terminal session if I need to see console output, otherwise for routing operation of it I use a script I built.

But.... transverter...eh? Ya lost me on that one.

Hi, why don't you try with another SD card with a fresh OS?

Daniel,

That for sure would be a safer way to go, but then I'd wind up with an OS having none of the other applications on it that I am currently used to having available. And re-loading / customizing them all over would be a PITA.

One thing that I've tried, quite unsuccessfully, is to back up my RPi SD card on my Mac (or Windows 8.1) so that I'd have a "spare" OS card in case / when the main SD card dies. If anyone reading through this thread has a sure-fire way of backing up an SD card and getting it restored to a blank, it sure would be nice to have that info posted…

Googling says there is a dd command for OSX and winddd for XP, don't know if it works with later Windows versions.
I've used over a dozen OS's but neither of the above 2 have been in my armoury.

In Linux/Unix, dmesg will identify the SD card placed in the reader as mentioned in the install instructions, then "sudo dd if=/dev/sd? of=<mountpoint_of_USBstick_or_HD_partition>/Rpi.img bs=4M" creates an image file on a USB stick or hard drive.

Putting it to a new SD card is the same procedure as creating the original SD card but using Rpi.img.

I have quisk-3.5.4 and all others since on a hard drive in the /opt directory and even earlier versions on another HD.

Unpacking 4.0.4 creates a quisk-4.0.4 directory.
If launched in that directory with "python quisk.py" after "make" is run, it will read and use the contents of ~/.quisk_conf.py if it exists. Otherwise the GUI config can be used to do the job. This method does not alter anything.

If "sudo python setup.py install" is run it writes file to /usr/lib/python2.7/dist-packages/quisk/ or /usr/local/lib/python2.7/dist-packages/quisk/ and puts a "quisk" executable script in /usr/bin or /usr/local/bin so will overwrite what the previous run of "python setup.py install" did, including the quisk executable script.
"quisk" from the command line will then launch the latest version.
73 ... Sid.

Well, I know this is sort of off-thread, but I still need to ask for help on it, as it in a way is related to installing Quisk and having a backout plan…

There was a posting on the web where an RPi user backed up his SD card on Windows using Win32 Disk Imager. This evening I ran the backup of the SD card to my Windows 8.1 hard drive which took about an hour but came to a successful completion. I ejected my “good” RPi SD card, put it in a safe place, and then inserted a blank SD card into my SD card reader. I formatted it and tried to restore my backup .img file to it. In typical Windows fashion, it would not work. Tells me that the blank disk is not large enough. Interesting, as both are 32GB cards, bought in the same package. Here is a screen shot of the error:

Can anyone tell me what the heck is going on?

Get your good image out and use a ubuntu disk and shrink the free space down with Gparted or something before making the image ... and try again.

Once the new image is writen on the new SD, use the Ubuntu live CD again to make the partition fully taking up the space ...

Id guess that the new SD is not quite a full 32 gig ....

Hi Mike,
Physical sizes of SD cards from different manufacturers seem not always to be identical.

I have had to mount the root partition of img files and remove some excess files.
The img files can be treated like a regular hard drive.

```
root@sdrbox:/2# fdisk -l 2016-02-09-raspbian-jessie.img
Disk 2016-02-09-raspbian-jessie.img: 3.9 GiB, 4127195136 bytes, 8060928
sectors
Units: sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disklabel type: dos
Disk identifier: 0x3e7fd08e

Device Boot Start End Sectors Size Id Type
2016-02-09-raspbian-jessie.img1 8192 131071 122880 60M c W95

From: dan.tiganas@...
Topic: 2100 Message: 2110

Hi Jim, I am using Apple Pi Baker app on Mac Osx to backup and restore Raspberry PI SD's with no problems. What I usually do is to prepare an image with the OS and the minimum set of applications, test it and then back it up using Apple pi backer. I also have backups of "production" images in case of a sd failure, wich can occur during research.

Hi,

Is the 6300 still covered by the warranty?

Thanks,

Andrew

2113. Quisk 4.0.4 on Raspberry Pi - Install Problem

Yahoo group: n2adr-sdr
Date: 2016-03-09 00:44:50 UTC
From: w6jhb@...
Topic: 2113 Message: 2113

Just built a fresh boot disk for my RPi2 - Raspian Jessie. Installed the pre-req packages listed on the Quisk Installation web page. When I tried starting up Quisk I get the following error:

```
Traceback (most recent call last):
File "./quisl.py", line 34, in <module>
import _quisk as QS
ImportError: ./_quisk.so: wrong ELF class: ELFCLASS64
```

Are there other steps that need to be done or other packages to install that are not listed on the web page?

Thanks, Jim

Looks like you got a 64 bit quisk.so, and unless you have the new
Raspberri-Pi 3, it is a 322 bit machine.

73,

Rob

```
The released file is native x86, not ARM.
Run "make" to build a new _quisk.so for ARM.

Make sure the build-essential package is installed.

$ make
$ sudo python setup.py install

Thanks Sid - that made a huge difference!

I am no longer using a SoftRock Ensemble RXTX - I now have an OmniaSDR connected. Quisk starts up but with everything as a default, nothing plays. If I put my old quisk_conf.py file in my pi directory will that get me close enough to begin tailoring things?

Jim / W6JHB

Hi Jim,

if your quisk_conf.py worked before (with your OmniaSDR) then it should also work with Quisk 4.04.

Yep, thanks Sid et all - mine is now working. Had one system file to modify so I was authorized to mess with USB devices, and then it worked fine. I was confused at first with a couple fields that were displayed as the numbers didn't match what was in my config file. Turns out my config had the numbers as hex and the Quisk Config/Radio panel was showing them to me in decimal. Now THAT brought back memories from my old mainframe programming days!!!

2121. Quisk 4.0.4 vs Quisk 3.7.7 Audio Levels

Yahoo group: n2adr-sdr
Date: 2016-03-10 03:24:33 UTC
From: James Bennett
Topic: 2121 Message: 2121

Got another question for the experts in the group. I had been using v3.7.7 on my Raspberry Pi2 under Raspian Wheezy. I built a new OS disk with Raspian Jessie and installed Quisk 4.0.4 on it. After a few hiccups, today I was successful in getting it to work. In fact I had a nice 20 minute CW QSO with a fellow in Arizona on 20 meters. I was running my OmniaSDR at one whopping watt; the other station was running a TenTec station at 550 watts! My radio is an OmniaSDR 60/40/30/20 meter model.

Anyway, it seems to me that the audio level is very, very low on the new system. I have the volume slider in Quisk all the way up just to have a comfortable listening level. If I had done that with the old configuration, my ears would have been hurting. Has anyone else seen a drop in audio volume after upgrading to Quisk 4.0.4 and/or Jessie? Or, is there a setting somewhere that I can tweak to make it louder?

Tomorrow, if I can get the time, I will re-boot with the old OS and bring up the old Quisk 3.7.7, just to be sure I am not imagining this. If the old OS and old Quisk is in fact lots louder, I'll try to install Quisk 4.0.4 on the old OS to see if it makes the volume lower.

Any thoughts...?

Verify levels and AGC setting on CW ....

did you check the pulseaudio levels with pavucontrol

and the audio slider on Quisk on the far left?

Date: 2016-03-10 11:20:33 UTC
From: Sid Boyce
Topic: 2121 Message: 2123

Using pavucontrol or alsamixer should work.

It looks like OmniaSDR has an onboard sound card.
check what "cat /proc/asound/cards" says, e.g
root@hiqsdr-desktop:~# cat /proc/asound/cards
0 [ALSA]: bcm2835 - bcm2835 ALSA
bcm2835 ALSA
1 [Device]: USB-Audio - USB PnP Sound Device
C-Media Electronics Inc. USB PnP Sound Device at
usb-3f980000.usb-1.3.1, full s
Run alsamixer, select each card or and check the volume sliders are set
to or near maximum.

2124. Re: [n2adr-sdr] Install of Quisk V4 Question

Yahoo group: n2adr-sdr
Date: 2016-03-10 12:32:04 UTC
From: Sid Boyce
Topic: 2100 Message: 2124

Yesterday I got a couple of 64GB class 10 SD cards and I used one to upgrade from the 16GB used with the ODROID-C2.

Using an old Zotac MaG mini-PC with Kubuntu 15.10 x86_64 installed.
dmesg said the 16GB card was /dev/sdd with partitions /dev/sdd1 and /dev/sdd2.
dd if=/dev/sdd of=Ubuntu1604_16GB.img bs=1M conv=fsync

Put the 64GB card in the reader.
dd if=Ubuntu1604_16GB.img of=/dev/sdd bs=1M conv=fsync

When it was done removed and reinserted the SD card then ran "gparted /dev/sdd" and extended partition 2 to use all the free space 63871 = (15064 existing + 48807 unused).
Quit gparted, ran "fsck -a /dev/sdd1" twice, clean on second run, then "fsck -a /dev/sdd2" which reported clean.

New 64GB SD card inserted in the -C2, booted up, quisk-4.0.4 running Hermes-Lite with a 7 inch touchscreen (1920x1080 resolution) and HMDI audio with built-in amplifier and speaker.

The ODROID-C2 is very fast with 64-bit Ubuntu ARM.
Only 32-bit distros for the Pi 3 are currently available. Also Pi 3 only has half the memory of the -C2, 1.2GHz CPU speed and a 100MBit Ethernet.
http://techfrag.com/2016/03/08/raspberry-pi-3-competitor-odroid-c2-is-much-more-powerful-costs-only-5-more/

Some time later I'll also backup the 64GB card.

Hi Mike,
All the Mali 450-MP3 GPU support is in by default.

2125. Redipitaya XTAL-Freq --function??

Yahoo group: n2adr-sdr
Date: 2016-03-10 14:50:49 UTC
From: michael.hartje@...
Topic: 2125 Message: 2125

Dear List,

Quisk 4.0.4 supports redpitaya. so I use it via enet on a linux system with SDR_HPSDR binaries from Pavel Demin. The RP act like a hpsdr. Quisk works on linux system together with RP.

The hardware has a frequency deviation. In the config--> hardware there is a dialog named "Clock Frequency Hertz" with preset value of 125MHz (125000000). -- this is the sample rate.
When I change this value to correct the frequency deviation, there seems to be no influence even after a restart of quisk.

Does anybody knows a little more about that? Does anybody had success to correct the frequency deviation with the redpitaya?
What should I do in an other way?

Thanks in advance

Michael

2126. Re: [n2adr-sdr] Quisk 4.0.4 vs Quisk 3.7.7 Audio Levels

Yahoo group: n2adr-sdr
Date: 2016-03-10 17:47:59 UTC
From: James Bennett
Topic: 2121 Message: 2126

Sid and Mike -

Thanks to both for the suggestions on my low audio level. The solution was running alsamixer. Looks like the default setting on a newly built Jessie system is around 40 percent. I moved it up to 94 percent and what a difference! I was about to say that the OS really should have an easier way to change volume levels when.... OMG - there it was in the bottom right corner of the System Panel - the little speaker icon. Perhaps it's time for some new reading glasses! Arrghhhhhh...!

2128. Re: [n2adr-sdr] Quisk 4.0.4 vs Quisk 3.7.7 Audio Levels

Yahoo group: n2adr-sdr
Date: 2016-03-11 11:40:30 UTC
From: Sid Boyce
Topic: 2121 Message: 2128

Hi Jim,
In the early days of Linux the volume used to be set to 100% resulting
in a deafening screech on startup.
On some systems it will come up with a low value or muted which was the
first solution to the original problem.
73 ... Sid.

Hi Mike,
The image I backed up was just the standard 4GB
ubuntu64-16.04lts-mate-odroid-c2-20160226.img with partition 2 expanded
to fill the 16GB SD card using gparted and configured for touch, UK
keyboard and other settings plus additional packages from the repo and
quisk-4.0.4 and ~/quisk_settings.json.
73 ... Sid.

2131. remote audio

Yahoo group: n2adr-sdr
Date: 2016-03-22 12:54:46 UTC
From: n1xbm@...
Topic: 2131 Message: 2131

I am new to Quisk on my ubuntu desktop 14.04. I already use desktop sharing which works fine. I noticed in the quisk software a mention to pulse audio. I got poking around and I saw that you can basically stream audio from one computer to another on a LAN. So I set my ubuntu desktop running 14.04 as the server and my laptop running 14.04 as well. I got so far as to see the sound card on my desktop, but I can not get any audio to pass to my laptop.

Is there anyone that can help with this?

Also is this what people are doing for remote operation of quisk? The desktop sharing seems to control things just fine. I just need audio.

Thank you,
Bob/N1XBM

Any one know if Tx audio from remote on SSB to a IQ type radio is still messed up or not on ghpsdr3-alex ?

Sid,

Thanks it helps a little bit. I've gotten as far as I have from multiple websites using google. This link you've sent is a new one to me. I fear I will need some help from someone who has already done it. Worst case scenario is I'll figure it out eventually. I was hoping someone here has done it and can lend a hand.

I was hoping to get it going using mp3 before I added the wrinkle of SDR.

From: Sid Boyce
Topic: 2131 Message: 2135

I used to configure pavucontrol and paprefs, but with 8 PC's and SBC's
the mixer GUI's got overcrowded with the sound cards from every system
appearing on them all.

I think the idea with ghpsdr3-alex and QtRadio was to have all these
local and remote sound cards available on all systems.

You could configure pavucontrol and paprefs, then see if quisk Config
shows them all.

My only experience was when QtRadio was mistakenly configured with a
remote sound card and I wondered why I got no local audio.
73 ... Sid.

From: peter@...
Topic: 2131 Message: 2136

Hi Bob,

I do not have an answer regading the audio issue, other than that I'm (trying to) dig into it myself. I intend to use 2 instances of Quisk at 2 locations. One at home serving as a platform which will show the Graph, Waterfall, and control etc. The other one residing at my remote location and doing the number crunching and actual receive and transmit. So far I've managed to get remote control of the buttons and I transfer the Graphical data using just 1 Byte per pixel, hence minimising the data to be transmitted across Internet. One of the last things to resolve is sending back and forth audio. The audio is available within the Quisk Software as a 48 kHz sampled data flow (I suppose...), which is send to a USB audio card. In stead of sending it to a soundcard I like to have it forward to an UDP Socket, after having performed some processing: In order to minimise the flow of data across (sometimes narrow band!) internet, I opt to use uLaw compression and to sample at say 12 kHz. But having said that, I still need to find out how to get my hands on that audio stream and diect it to a socket!

Not much of help I guess, just letting you know that you're not the only one trying to get audio across a certain distance, using ethernet/internet!

73s,

Peter, PA3BIY

Ok some success!

I got the pulse server working. I was streaming an mp3 using rythmbox on desktop to my laptop great!

I got quisk running on my desktop and have local audio at the desktop.

When I look pavucontrol I do not see the audio source, like I did when I was playing an mp3.

I see there are settings in quisk for a pulse server. I also assume I must have to route the audio so pulse can see it.

Anyone ever done this before?

BTW the links posted at the start of thr topic got me this far. Thank you!

Bob,

Quisk has options to use a remote pulseaudio device as an iq audio source. Take a look at my old site km4dsj.wordpress.com for more info on my setup. If you want to stream baseband audio only to the laptop, then you will have to setup a tunnel with pulseaudio. Let me know if this makes sense after looking at the link.

Eric, It sort of does...I have a lot of questions. At the moment I'm able to load a mp3 on the same computer running quisk and hear that audio on my remote laptop. At the moment I am having these issues.

1. I can not stream audio to my laptop, So far I am only using the gui in ubuntu to play with pulse audio paprefs and pavucontrol.

2. I have mirror images on my waterfall.

3. I used the ensemable 2 sample file that came with quisk. I didn't change anything and things are kinda sorta working. I went to look the file and there is a # in front of everything. Its my understanding in linux that the line is commented out and ignored, but things are obviously working a little bit.

Bob,

Sorry, I was trying to run out the door to work and didn't fully read the email chain.

If you want to stream to your laptop, you want the laptop "sink" to appear on your desktop which is running quisk. You can use the paprefs app on your laptop to share the sink, and then use paprefs on the desktop to enable it.

laptop - paprefs, Network Server tab, check "enable network access to local sound devices"
desktop - paprefs, Network access, check "make discoverable network devices availiable locally"

desktop - Quisk, config, "your radio", sound, and change sound device to your laptop device for the stream called "Radio Audio Output". The remote device on your laptop probably has the word "tunnel" somewhere in the name.

One problem you may run into....

The "tunnel" protocol that pulseaudio uses has a lot of overhead and doesn't handle network latency well. I tried everything I could to get it to work reliably but eventually I gave up and rewrote the Quisk pulseaudio backend. This allowed the option to connect to a remote pulseaudio server directly, without using a tunnel. It also allowed some fine tuning of the stream settings to prevent latency from building due to network or CPU lag. If you don't get satisfactory results, I can help you try that route. I originally wrote it so that the raspberry pi hooked to my Softrock could simply stream the IQ audio to may laptop, which does the number crunching. What are the specs on the laptop? I've had Quisk running on an old Dell Inspiron circa 2005 with no issues on Ubuntu 14.04. And I'm streaming 2 channel 96khz @16bits over wifi.

Eric,

Lots of good information.

OK I got things working better, I've abandoned streaming audio until things work locally. I'm having a nagging issue I can not figure out.

On 80m I checked CHU on 3330. It's spot on, but I also see CHU on 3300, which I know isn't right.

On SSB everything works like it should but I'm having the same problem, mirrored signals

2145. Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-24 05:21:00 UTC
From: James Bennett
Topic: 2145 Message: 2145

OK guys, need some help here. I am running Quisk 4.0.4 on a Raspberry Pi3 with Jessie. My WSJT-X is version 1.7.0. Also have FLDIGI. My radio is an OmniaSDR. Quisk works great for me in CW mode by itself. My problem is with transmitting from either of those two digital applications.

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal out to my antenna!

Any hints would be appreciated.

Yep - Hermes-Lite and HiQSDR .... so only 1 sound card needed.
On the ODROID-C2 HDMI audio works so I use it for speaker output for
Hermes-Lite, speakers are included in the 7 inch touchscreen and I use
the USB sound card for Microphone.

The touchscreen on the Pi 2 does not have HDMI sound so I use a USB
dongle for both Mic and driving a 4W amp for sound output from the HiQSDR.

> you don't have the audio routing done right ....

Probably (maybe) but it isn’t obvious to me.

On Quisk I have the Digital Input and Digital Output both set to hw:3,0 and that’s what the Quisk doc sez. Over in FLDIGI, in the Configure—>Sound Card—>Audio—>Devices, I have both Capture and Playback set to hw:3,1.

Doesn’t seem logical to me, but this is the way the documentation sez to set it up. As I said in my original post, FLDIGI and WSJT-X can both receive and decode signals very well. Rig control works on both applications (frequency changes and T/R switching). I just don’t get either one to make the OmniaSDR send any output. I’m using two ways to see that: a second receiver (Elecraft K3) and a watt meter that has scales of 0-100 W, 0-1 W, and 0-100mw. When set at the mw level the needed never moves, so for sure no RF is coming out.\

If I set the OmniaSDR up for CW, it works just fine and produces a nice 1w signal, so it for sure can transmit with Quisk.

What else can be wrong??

Jim

set the digital program to Tx tune ....

then use pavucontrol and to see the levels between programs and see if the audio from wsjt-x is going where you want it to ....

the path is NOT static, when wsjt-x quits Txing, the Tx audio thread disappears ...

Subject: [n2adr-sdr] Quisk / WSJTX Transmit Problem

OK guys, need some help here. I am running Quisk 4.0.4 on a Raspberry Pi3 with Jessie. My WSJT-X is version 1.7.0. Also have FLDIGI. My radio is an OmniaSDR. Quisk works great for me in CW mode by itself. My problem is with transmitting from either of those two digital applications.

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal out to my antenna!

Any hints would be appreciated.

Mike,

Everything on this RPi appears to be ALSA, not Pulse. Running pavucontrol only gives me the built-in audio output port on the RPI. When I run alsamixer, it shows all the ALSA devices, including the Loopback device.

On a recommendation from Bill G4WJS from the WSJTX development team, I changed WSJTX output to go to the default / system output: the speakers on my monitor. Doing that produces a nice clean tone when I press the Tune button. So, WSJTX is sending a tone signal out the door, but Quisk doesn't seem to be hearing it, or does not want to send it to the radio. It sends the stuff from the radio over to WSJTX and FLDIGI, but not the other way.

Wonder what else in Quisk needs changing?

Very strange.

Jim

2154. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-25 04:45:29 UTC
From: James Bennett
Topic: 2145 Message: 2154

I'm curious if ANYONE has been successful with Quisk 4.0.4 and FLDIGI and/or WSJTX? I'm doing it exactly as documented on the Quisk web site. Neither FLDIGI nor WSJTX are having their audio picked up by Quisk with the setup this way. Those two applications ARE sending the audio tones out as they should, because when I tell them to send to the HW:0 device it hits my speakers just fine.

I can put screen shots of my configurations up on the group's file section, if that will help.

This whole thing is soooo close to working; I can send CW from Quisk, I have FLDIGI and WSJTX reading and decoding signals very well. What the heck is up with the transmit part?

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

I'm curious if ANYONE has been successful with Quisk 4.0.4 and FLDIGI and/or WSJTX? I'm doing it exactly as documented on the Quisk web site. Neither FLDIGI nor WSJTX are having their audio picked up by Quisk with the setup this way. Those two applications ARE sending the audio tones out as they should, because when I tell them to send to the HW:0 device it hits my speakers just fine.
I can put screen shots of my configurations up on the group's file section, if that will help.
This whole thing is soooo close to working; I can send CW from Quisk, I have FLDIGI and WSJTX reading and decoding signals very well. What the heck is up with the transmit part?

Mike,

Everything on this RPi appears to be ALSA, not Pulse. Running pavucontrol only gives me the built-in audio output port on the RPI. When I run alsamixer, it shows all the ALSA devices, including the Loopback device.

On a recommendation from Bill G4WJS from the WSJTX development team, I changed WSJTX output to go to the default / system output: the speakers on my monitor. Doing that produces a nice clean tone when I press the Tune button. So, WSJTX is sending
a tone signal out the door, but Quisk doesn’t seem to be hearing it, or does not want to send it to the radio. It sends the stuff from the radio over to WSJTX and FLDIGI, but not the other way.

Wonder what else in Quisk needs changing?

Very strange.

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

you don't have the audio routing done right ....

Probably (maybe) but it isn’t obvious to me.

On Quisk I have the Digital Input and Digital Output both set to hw:3,0 and that’s what the Quisk doc sez. Over in FLDIGI, in the Configure—>Sound Card—>Audio—>Devices, I have both Capture and Playback set to hw:3,1.

Doesn’t seem logical to me, but this is the way the documentation sez to set it up. As I said in my original post, FLDIGI and WSJT-X can both receive and decode signals very well. Rig control works on both applications (frequency changes and T/R switching). I just don’t get either one to make the OmniaSDR send any output. I’m using two ways to see that: a second receiver (Elecraft K3) and a watt meter that has scales of 0-100 W, 0-1 W, and 0-100mw. When set at the mw level the needed never moves, so for sure no RF is coming out.\

If I set the OmniaSDR up for CW, it works just fine and produces a nice 1w signal, so it for sure can transmit with Quisk.

What else can be wrong??

Jim

Subject: [n2adr-sdr] Quisk / WSJTX Transmit Problem

OK guys, need some help here. I am running Quisk 4.0.4 on a Raspberry Pi3 with Jessie. My WSJT-X is version 1.7.0. Also have FLDIGI. My radio is an OmniaSDR. Quisk works great for me in CW mode by itself. My problem is with
transmitting from either of those two digital applications.

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal
out to my antenna!

Any hints would be appreciated.

From: Eric Thornton
Topic: 2145 Message: 2159

To install pulseaudio, just type "sudo apt-get install pulseaudio". Do the same for "pavucontrol".

It should detect any alsa devices automatically. You will probably want to add a null sink as your wsjtx playback device and then use the nullsink.monitor stream for input to quisk.

This definitely sounds like an audio routing problem.

Eric, Mike, et al - turns out that Pulseaudio IS already installed on the RPi - guess I was blind! I was hoping that I could use the ALSA loop back as described on the Quisk web page; I have it set per the documentation but no joy. So, it looks like I've got to go with Pulseaudio. I "think" I have a null sink set up and will attempt to get Quisk and WSJTX to speak to each other that way. It's a struggle for me, as I'm most certainly a Linux rookie, but I'm learning (slowly!).

2162. RE: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-28 05:15:49 UTC
From: MIKE DURKIN
Topic: 2145 Message: 2162

you should be able to use the snd-aloop ... i do .... between quisk and wsjt

I had to rebuild my kernel to enable it ....
Least that's what Sid had me do some time ago ...

with quisk running, and with quisk using the digital ssb/FM button not greyed out ... and quisk audio set to the loopback sink for digital .... put wsjt into tune mode, move its power slider to max, then check pavucontrol playback tab and see if there is a qt-blah-blah sound thread .... make sure that this is set to the snd-aloop ....

stop wsjt tune and the playback thread should disappear (it is not static and will not remain)

The qt-blah-blah-blah thread under the recording tab should point to the snd-aloopMonitor

This is what i remember as how i got it to work on my Odroid-x2 (Ubuntu 14.04 32bit) ... C2 is soon to be replacing it, as soon as i get a HDMI cable and a bluetooth keyboard/touchpad combo in the mail.

It should detect any alsa devices automatically. You will probably want to add a null sink as your wsjtx playback device and then use the nullsink.monitor stream for input to quisk. This definitely sounds like an audio routing problem.

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

you don't have the audio routing done right ....

Probably (maybe) but it isn’t obvious to me.

On Quisk I have the Digital Input and Digital Output both set to hw:3,0 and that’s what the Quisk doc sez. Over in FLDIGI, in the Configure—>Sound Card—>Audio—>Devices, I have both Capture and Playback set to hw:3,1.

Doesn’t seem logical to me, but this is the way the documentation sez to set it up. As I said in my original post, FLDIGI and WSJT-X can both receive and decode signals very well. Rig control works on both applications (frequency changes and T/R switching). I just don’t get either one to make the OmniaSDR send any output. I’m using two ways to see that: a second receiver (Elecraft K3) and a watt meter that has scales of 0-100 W, 0-1 W, and 0-100mw. When set at the mw level the needed never moves, so for sure no RF is coming out.\

If I set the OmniaSDR up for CW, it works just fine and produces a nice 1w signal, so it for sure can transmit with Quisk.

What else can be wrong??

Subject: [n2adr-sdr] Quisk / WSJTX Transmit Problem

OK guys, need some help here. I am running Quisk 4.0.4 on a Raspberry Pi3 with Jessie. My WSJT-X is version 1.7.0. Also have FLDIGI. My radio is an OmniaSDR. Quisk works great for me in CW mode by itself. My problem is with transmitting from either of those two digital applications.

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X

results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal out to my antenna!

Any hints would be appreciated.

Gentlemen - we have ignition and liftoff! Sort of.

I added a null sink and then put them into Quisk and WSJT-X. Lo and behold, I can now receive and send WSPR2. That was the good news. The bad news is that there is a pretty large latency issue on the receive end. I'll do some reading and maybe play around with Quisk settings to see if there are any tweaks I can make to fix this. Before adding the sink to Quisk there was almost no latency issue being reported. Now it is pretty bad - I can hear really choppy audio in my headphones.

Any suggestions?

Tnx, Jim / W6JHB

2164. RE: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-28 19:03:09 UTC
From: MIKE DURKIN
Topic: 2145 Message: 2164

I think that is something to do with the P2 ... not having quite enuff HP to do both ... least both waterfalls ...

Try closing the wsjt waterfall ...

The choppy is from not enough buffer /slash/ too much latency .... most latency being from the lack of GPU horses to do the lifting .... youll just need to increase adjust the Quisk values to see ....

I and a few others are going with the Odroid-C2 to get more performance ...
I hope that Jim will offer a 64bit version of his wonderful program ....

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal out to my antenna!

Any hints would be appreciated.

2165. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-28 23:04:01 UTC
From: James Bennett
Topic: 2145 Message: 2165

Just as an FYI, I'm using an RPi3 which has a bit more horsepower than the V2. But, perhaps that's still not enough….

To my newbie eyes, this entire latency thing appears to be due to having to use a loopback sink to get the audio tones back to Quisk from WSJTX. Why do I say this? Well, with the following settings in Quisk and WSJTX, receiving and decoding of WSPR2 signals works great. Very little latency, almost no choppiness in the audio to my headphones:

Quisk: Digital Output = alsa:Peaberry Loopback PCM(hw:3,0)
Digital Input = alsa:Peaberry Loopback PCM(hw:3,0)

WSJTX audio Input = plughw:CARD=Loopback,DEV=1
audio output = plughw:CARD=Loopback,DEV=1

The above results in fine decoding, as I mentioned. But the audio tones are not making it back to the OmniaSDR wen I press the Tune button in WSJTX. Note that those selections are NOT the sink loopback that was suggested by Eric, WW4ET.

It sure seems that there ought to be some setting between these two applications that would make the audio flow to Quisk for transmit. If we can't figure this out, then using Quisk 4.0.4 and WSJTX 1.7.0-devel for receiving and transmit on an RPi3 simply isn't gonna happen., and I'll be relegated to having a receive-only WSPR setup.

Any other ideas on this to avoid that latency-prone sink approach?

> I added a null sink and then put them into Quisk and WSJT-X. Lo and behold, I can now receive and send WSPR2. That was the good news. The bad news is that there is a pretty large latency issue on the receive end. I'll do some reading and maybe play around with Quisk settings to see if there are any tweaks I can make to fix this. Before adding the sink to Quisk there was almost no latency issue being reported. Now it is pretty bad - I can hear really choppy audio in my headphones.

The Pi 2 kernel already comes with the snd-aloop module - "sudo modprobe snd-aloop".
Depending on the platform you build it on, quisk is 32-bit or 64-bit.

```
root@hiqsdr-desktop:~# modinfo snd-aloop
filename: /lib/modules/4.1.15-v7+/kernel/sound/drivers/snd-aloop.ko
license: GPL
description: A loopback soundcard
author: Jaroslav Kysela <perex@...>
srcversion: 65034E42B02FA4FF82BC79B
depends: snd-pcm,snd
intree: Y
vermagic: 4.1.15-v7+ SMP mod_unload modversions ARMv7
parm: index:Index value for loopback soundcard. (array of int)
parm: id:ID string for loopback soundcard. (array of charp)
parm: enable:Enable this loopback soundcard. (array of bool)
parm: pcm_substreams:PCM substreams # (1-8) for loopback
driver. (array of int)
parm: pcm_notify:Break capture when PCM format/rate/channels
changes. (array of int)
root@hiqsdr-desktop:~#

root@odroid64:/opt/quisk-4.0.4# file _quisk.so
_quisk.so: ELF 64-bit LSB shared object, ARM aarch64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=3a0c823059638bc8889ad05bb1512095e62f6248, not stripped
root@odroid64:/opt/quisk-4.0.4#
```

2167. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-28 23:30:21 UTC
From: Sid Boyce
Topic: 2145 Message: 2167

Why not run wsjtx standalone?

When I had Softrock/UHFSDR I ran wspr, wsjtx and fldigi standalone
before Jim wrote up how to use them with quisk.
73 ... Sid.

2168. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-28 23:41:15 UTC
From: James Bennett
Topic: 2145 Message: 2168

Oh, but I wish i could do that!!!! When I was using my SoftRock Ensemble RXTX on my RPi2, that is exactly what I was doing, but I was using the stand-alone WSPR2 software, not WSJT-X. So, I upgraded from Wheezy to Jessie, put in a new RPi3 and opted to install the full WSJT-X, so that I might try out JT65 and JT9 with the RPi. Unfortunately, the version of Hamlib that I've gotten does not have an entry in it for the OmniaSDR, or a Peaberry SDR, or any such sort of thing. So, after several email exchanges with folks in this Yahoo group and the Omnia Yahoo group, I reluctantly went the rout of having Quisk as the intermediary between the SDR and WSJT. Not fun.

I would LOVE to figure out how to avoid this, as it has cost me untold hours of grief and I am still not at the point where it is working satisfactorily.

Sid - any help you may be in getting my 1.7.0-devel version of WSJTX to work w/o going through Quisk would be greatly appreciated.

p.s. - I have no beef with Quisk - it is a great piece of software and I do enjoy using it for QRPp CW contacts…

Jim / W6JHB

2169. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-29 19:19:46 UTC
From: Eric Thornton
Topic: 2145 Message: 2169

When the audio is choppy, have a look at the audio device latency in the configure tab. The way quisks sound loop is programmed, if a device cannot playback samples due to cpu or network bandwidth it drops the samples in pulseaudio.

What are your playback latency and sample poll set to? Can't remember the exact names and I'm at work now. I keep my playback latency around 300ms and sample poll at 20000us. Keeps cpu load low while latency is still low enough for wsjtx.

Eric

2170. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-29 21:12:34 UTC
From: Sid Boyce
Topic: 2145 Message: 2170

wsjtx is a long build. The INSTALL file is not too bad but could be simpler.

There were a number of pre-req packages, asciidoctor and asciidoc bring
in lots of other packages, cmake suggests an option to make to ignore
wsjtx manpages.
All the files listed here are all the ones I installed when complaints
seen in cmake and make plus others such as rtl-sdr and other stuff I
have been installing.

apt-get install sshpass libqt5multimedia5 libqt5multimediawidgets5
reboot libx11-dev mlocate qt5-qmake libopenmpi-dev libopenmpi1 \
libqt5multimedia5-plugins libqt5multimediaquick-p5 qtmultimedia5-dev
libqwt-headers wx3.0-headers libboost-thread-dev libzthread-dev \
rtl-sdr librtlsdr-dev texinfo f2c cfortran gfortran asciidoctor asciidoc
libudev-dev

For hamlib

../autogen.sh --prefix=/usr/local --disable-shared --enable-static
--without-cxx-binding --disable-winradio CFLAGS="-fdata-sections
-ffunction-sections" LDFLAGS="-Wl,--gc-sections"

For wsjtx
----
root@odroid64:/usr/src/wsjtx/build# cmake -D CMAKE_PREFIX_PATH=/usr/local ..

Near the end make can't find libudev ---- "ln -sf
/lib/arm-linux-gnueabihf/libudev.so.1 /usr/lib/"
-- Install configuration: "RELEASE"
-- Installing: /usr/local/bin/wsjtx
-- Installing: /usr/local/bin/jt9
-- Installing: /usr/local/bin/jt65code
-- Installing: /usr/local/bin/jt9code
-- Installing: /usr/local/bin/jt4code
-- Installing: /usr/local/bin/wsprd
-- Installing: /usr/local/bin/message_aggregator
-- Installing: /usr/local/bin/udp_daemon
-- Installing: /usr/local/bin/rigctl-wsjtx
-- Installing: /usr/local/bin/rigctld-wsjtx
root@odroid64:~# rigctl-wsjtx -l | grep Peaberry
2516 AE9RB Si570 Peaberry V1 0.3 Beta
2517 AE9RB Si570 Peaberry V2 0.2 Beta
73 ... Sid.

2171. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-29 21:51:37 UTC
From: James Bennett
Topic: 2145 Message: 2171

Sid - one of the questions I have is why I don't have a Peaberry V2 entry in my Hamlib drop downs.

Yes, the WSJTX build is a pretty long process; I did it last week, several times! I used a procedure from Bill G4WJS. The hamlib part of it (done prior to the make of wsjtx), per his documentation was:

```
mkdir ~/hamlib3
cd ~/hamlib3
git clone git://git.code.sf.net/u/bsomervi/hamlib
<git://git.code.sf.net/u/bsomervi/hamlib> src
cd src
git checkout integration
mkdir ../build
cd ../build
```

../src/autogen.sh –prefix=$home/hamlib3 ……..> and then the same stuff as your

So, I'm wondering how I wound up with a version of hamlib that doesn't seem to have the most recent list of rigs? How can I tell exactly what I've gotten by using the above procedures?

If I need to re-do hamlib and re-compile wsjtx, that's no biggie, I feel pretty comfortable doing that now.

Jim / W6JHB

2172. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-29 22:54:32 UTC
From: Ron
Topic: 2145 Message: 2172

Hi Jim,

That is why WSJT-X does not have the AE9RB entries. I'm pretty sure if hamlib is already installed the WSJT-X build process will not use the embedded version that comes with it. You need to remove the version that is installed and then do a "make clean" in the directory that was used for the original WSJT-X build.
Then do the make again. The AE9RB entries are the top of the list.

2173. Quisk dark color scheme 4.0.4

Yahoo group: n2adr-sdr
Date: 2016-03-29 23:04:08 UTC
From: Robert Newberry
Topic: 2173 Message: 2173

I am running version 4.0.4 It looks like I can change the color scheme, but I'm confused most everything mentions adding the lines of code to the config file, but 4.0.4 supposedly I can make these changes in the config tab, but all I can see is changing font sizes.

Thank you for any help you can offer.

2174. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-29 23:08:30 UTC
From: Sid Boyce
Topic: 2145 Message: 2174

You have installed hamlib in $home/hamlib3/bin
What does "~/hamlib3/bin/rigctl -l | grep Peaberry" return?

Possibly you still have the old hamlib packages installed -- "dpkg -S
`which rigctl`"
"dpkg -l | grep hamlib" will list the packages, "apt-get remove
<packages>" will get rid of them.

I chose "--prefix=/usr/local" so the binaries get installed in
/usr/local/bin which is a regular PATH for executables.
73 ... Sid.

2175. Re: Quisk dark color scheme 4.0.4

Yahoo group: n2adr-sdr
Date: 2016-03-30 01:35:54 UTC
From: Robert Newberry
Topic: 2173 Message: 2175

I got the dark color theme working great. For what ever reason on the graph where I would see span of frequencies that area is white and blank. I've tried a few things with out any luck. I basically just commented out the default theme and the removed the comments.

Does anyone know how to fill that area black and use white or grey text. I seem to be not having any luck.

Thank you

2176. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-30 04:13:48 UTC
From: James Bennett
Topic: 2145 Message: 2176

Sid,

See interspersed, below:
> On Tuesday, Mar 29, 2016, at Tuesday, 4:08 PM, Sid Boyce g3vbv@... [n2adr-sdr] <n2adr-sdr@yahoogroups.com> wrote:
>
> You have installed hamlib in $home/hamlib3/bin
> What does "~/hamlib3/bin/rigctl -l | grep Peaberry" return?
I get nothing after running this, so I assume it found no hit on that word.
>
> Possibly you still have the old hamlib packages installed -- "dpkg -S
> `which rigctl`"
> "dpkg -l | grep hamlib" will list the packages, "apt-get remove
> <packages>" will get rid of them.
I ran a list of them and here is what it returned:

pi@raspberrypi:~ $ dpkg -l | grep hamlib
ii libhamlib-utils 1.2.15.3-2+b1 armhf Utilities to support the hamlib radio control library
ii libhamlib2 1.2.15.3-2+b1 armhf Run-time library to control radio transceivers and receivers
pi@raspberrypi:~ $

So - looks to me like the only thing I have is hamlib v2, correct? And if I do the "apt-get remove xxxxxxxxx" they'll be gone.

You are showing –prefix=/usr/local for the hamlib stuff. Sorry, but I'm confused - how will the hamlib files get installed into that location?

Jim

2177. Re: Quisk dark color scheme 4.0.4

Yahoo group: n2adr-sdr
Date: 2016-03-30 19:38:09 UTC
From: jahlstr@...
Topic: 2173 Message: 2177

Hello,

Most options can be made in the radio configuration screens, but not all. The color scheme must be set in the config file. Read the file quisk_conf_defaults.py to see what can be changed. Copy lines from there to your config file.

Jim

2178. Re: [n2adr-sdr] Re: Quisk dark color scheme 4.0.4

Yahoo group: n2adr-sdr
Date: 2016-03-30 21:02:12 UTC
From: Robert Newberry
Topic: 2173 Message: 2178

Jim, thanks I did find that information and I uncommented the lines.

What I can't figure out is on the graph there is a white border around the edges of the graph. Where you would normally see the span of frequencies there isn't any its blank. I'd like to get those back. I've tried some trial and error with out luck. I'd also like to get rid of the white border. I can attach a screen shot if that would explain my problem better?

Is there anyone willing to share those settings?

2179. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-03-31 00:16:58 UTC
From: Sid Boyce
Topic: 2145 Message: 2179

```
"sudo apt-get remove libhamlib2 libhamlib-utils" to get rid of the
packages from the repo.

In the file wsjtx/INSTALL -- Instead of --prefix=$home/hamlib-prefix I
use --prefix=/usr/local
-----------------------------------
$ mkdir ~/hamlib-prefix
$ cd ~/hamlib-prefix
$ git clone git://git.code.sf.net/u/bsomervi/hamlib src
$ cd src
$ git checkout integration
$ mkdir ../build
$ cd ../build
$ ../src/autogen.sh --prefix=/usr/local \
--disable-shared --enable-static \
--without-cxx-binding --disable-winradio \
CFLAGS="-fdata-sections -ffunction-sections" \
LDFLAGS="-Wl,--gc-sections"
$ make
$ make install
-------------------------------------------------
The above builds and installs hamlib files under /usr/local
# ls -l /usr/local/bin/rig*
-rwxr-xr-x 1 root root 3240728 Mar 29 20:37 /usr/local/bin/rigctl
-rwxr-xr-x 1 root root 3245576 Mar 29 20:37 /usr/local/bin/rigctld
-rwxr-xr-x 1 root root 3245576 Mar 29 20:37 /usr/local/bin/rigctld-wsjtx
-rwxr-xr-x 1 root root 3240728 Mar 29 20:37 /usr/local/bin/rigctl-wsjtx
-rwxr-xr-x 1 root root 3162152 Mar 29 20:37 /usr/local/bin/rigmem
-rwxr-xr-x 1 root root 3219496 Mar 29 20:37 /usr/local/bin/rigsmtr
-rwxr-xr-x 1 root root 3128792 Mar 29 20:37 /usr/local/bin/rigswr

# ls -l /usr/local/bin/*wsjtx*
-rwxr-xr-x 1 root root 3245576 Mar 29 20:37 /usr/local/bin/rigctld-wsjtx
-rwxr-xr-x 1 root root 3240728 Mar 29 20:37 /usr/local/bin/rigctl-wsjtx
-rwxr-xr-x 1 root root 6199608 Mar 29 21:43 /usr/local/bin/wsjtx
# ls -l /usr/local/lib/libhamlib*
-rw-r--r-- 1 root root 5571734 Mar 29 20:37 /usr/local/lib/libhamlib.a
-rwxr-xr-x 1 root root 910 Mar 29 20:37 /usr/local/lib/libhamlib.la

In the section on building wsjtx --- Changed CMAKE_PREFIX_PATH to /usr/local
-----------------------------------------------
$ mkdir -p ~/wsjtx-prefix/build
$ cd ~/wsjtx-prefix
$ svn checkout svn://svn.code.sf.net/p/wsjt/wsjt/branches/wsjtx src

To build WSJT-X you will need CMake and asciidoc installed.
```

```
$ cd ~/wsjtx-prefix/build
$ cmake -D CMAKE_PREFIX_PATH=/usr/local ../src
$ cmake --build .
$ cmake --build . --target install
73 ... Sid.

hi Robert.

I have the same problem but using Linux.
Version 4.0.3 works OK, but version 4.0.4 has the problem on Pepprmint Linux,and Mint 17.3 but Penguy linux works OK on 4.0.3 and 4.0.4. Using the same dark .quisk.conf.py on all systems.

Dave.

Dave,
I am using ubuntu 14.04 LTS. I commented out the defualt theme and just un-commented the dark color theme. It works, but with the issues I previously mentioned. I still haven't figured out why. I am also using quisk 4.0.4.

Dave are you also having the same issue I am having? Such as the dark color theme works but with a white border around the graph and no span of frequencies at the bottom of the graph?

I've tried changing a bit here and there with out any luck getting what I want.

Robertyes just the same blanks out frequency display and up each side of Graph or waterfall display.Quisk 4.0.4 works OK on 15.1 Pinguy Linux.
Sorry I don't know the answer to the problem.

I read the other day if you mess up your config. There is a way to still load the program. I've looked around and can not find that information again.

I installed a new sound card, now when I load quisk it hangs up frozen.

Thank you

Rename or remove ~/.quisk_conf.py and ~/quisk_settings.json, start
quisk and use the Config button to setup a new Radio if ConfigFileRadio
is not correct.

Hi Jim,
Nothing is truncated as I thought.
Figured it out --- Click the Graph button and it reveals the other
options such as Wfall, Config, etc., the same for band selection and e.g
the USB button to reveal LSB/CW/DGT-U/FDV-U, etc.
73 ... Sid.

Hello,

Here is how to start Quisk with ConfigFileRadio:

Start quisk with the -a or --ask command line option to cause it to ask for the startup radio. That is, start quisk with "python quisk.py --ask" or "C:\python27\python.exe quisk.py --ask". Then specify ConfigFileRadio as the startup radio. Change the startup radio to "Ask me" until you get things fixed.

Then you can change your config file until things work again.

Hello Dave,

The dark color scheme in the config file was contributed code. More colors were added, but the dark scheme was not updated. Note the "colors are incomplete" comment at the end. You will need to add the missing colors to get it to work.

Jim
The difference between quisk 4.0.3 and 4.0.4 if you change the line 1352 color_graph, in quisk_conf_ defaults.py say from lemmonchiffon to blue,on 403 the graph screen and the boarder changes, on 404 only the graph screen changes,the boarder is a different color.it is this boarder that is causing the problem.This is on the normal display not the dark button display.(I know I shoudn't be playing in conf_defaults.py file but it is the only way I can describe It).

Hello Dave,

Here is a screen shot of what happens when I change "color_graph" to 'light blue' in quisk_conf_defaults.py. This is on Ubuntu 14.04 LTS. Please reply with a screen shot of what happens when you do it. If anyone else has some screen shots of the problem, that would help too.

Hello David,

I added line 1422 dc.clear ( ) in quisk.py because Ubuntu 14 won't work without it. It looks like there is a difference in our version of wxPython. Could you please thpe this into a terminal and tell me your version of wx? I could also use the versions from other people that are having this problem.

```
python
import wx
wx
wx.version()
```

Jim.
Thanks for your time,and trouble.(It should solve Roberts problem as well.)

Thanks again.

Ya I was starting to feel foolish because I'm getting replies saying "works fine for me" or "I'm doing it wrong" So I was getting discouraged. I'm glad the problem got hashed out.

2201. Quisk Version 4.0.5 April 2016

Yahoo group: n2adr-sdr
Date: 2016-04-07 18:15:09 UTC
From: jahlstr@...
Topic: 2201 Message: 2201

I added a new column to the Bands screen for transverter offset. I added the favorites file path to the Options radio screen. If you leave this blank, the default is used. I fixed a bug that caused a difference in drawing the graph screen between wx 2.8 and wx 3.0. I added additional sample rates 1536 and 1920 ksps.

2202. Need assistance with quisk

Yahoo group: n2adr-sdr
Date: 2016-04-09 02:53:34 UTC
From: Robert Newberry
Topic: 2202 Message: 2202

I'm hoping there is someone here who can help me get out of the ditch I'm in. I have been struggling for the last few weeks to get quisk going on my PC running ubuntu 14.04. I bought a asus pci-e sound card and I have had a woeful time getting it going. It works in terms of I can play music with it, but working with quisk is another story.

On the new install without any configuration everything loads and I can see band activity. The volume is extremely low. Turning the speaker volume up full blast I still have to put my ear to the speaker.

So once I configure things and restart quisk it either freezes. Or I try reconfiguring by picking other sound devices and those produce, different and undesirable results.

I'm getting very confused and discouraged that I can not make this work and I can not figure out why. I'm hoping there is someone out who might be able to take the time to straighten me out.

Thank you

2203. FreeDV on Quisk

Yahoo group: n2adr-sdr
Date: 2016-04-09 07:22:34 UTC
From: gvjury@...
Topic: 2203 Message: 2203

Hi Jim and group,

I just had to post on my first FreeDV QSO with VK3RV and VK3FPL/4. I sure was bubbling over with excitement after hours and hours of listening to the nominal frequencies for FreeDV over many days and not hearing a thing I managed to have an hour long QSO. What a fabulous facility you have provided Jim and after 55 years of ham radio you have brought me the same thrill I got from my first QSO on an old war surplus man pack set type 38. Things sure have come a long way and thanks for helping with the ride.

Oh yes BTW Quisk 4.0.5 fixed all the dark theme issues perfectly.

Hi Graeme,
Excellent news - that's why quisk is "the" app.

I hadn't tried FreeDV in a long time, must try it more often now the band conditions are much better. Just now tried 1200 mode on 14.236 but there is no FreeDV activity currently but the band is alive with Stateside stations.

Hi Sid,

Nice to hear from you and yes I spent a lot of time monitoring 14.236 and 14.240 to no avail. Perhaps those of us running Quisk should try to make contact. It is a difficult haul from ZL to G but maybe we could try and I have attached a propagation prediction for our path.

I have had one HiQSDR 10W 5 minute SSB QSO on 20m to ZL one afternoon
either last year or the year before.
I called not expecting him to come back but we had a pleasant QSO with
my report a solid 57.

I also had a couple QSO's to VK.

I had the BGA616 on the HiQSDR board die and blew the tracks so I built
a new BGA616 driver on a small piece of PCB, still to get around to
checking it out on TX again.

Got some repair work to do on the driven element of the 2-el Quad now
I've got it wound down.
73 ... Sid.

I just wanted to close this out. Some good folks on this list replied to me directly and I was able to get things going. After the dust settled it was all about getting my sound card working and choosing the right "ins and outs" in the software. Once I had that going I had to go into the daemon in ubuntu and turn up the sample rate to take advantage of the nice asus sound card I purchased. Everything seems to be under control now.

Thanks to all who replied.

2210. Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Topic: 2145 Message: 2210

Sid - I finally got back to attacking this problem of having the wrong hamlib installed - been busy doing some woodworking.

I successfully (I think) removed the old hamlib-2 stuff and then re-did the installs, using your adjusted method. All was going along fine until it got to the part of building WSJTX. Below is a copy/paste of the ugly part. Any idea (1) what is ludev, (2) why it isn't found with the modified steps, (3) how to resolve the problem?

```
.

2211. RE: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Yahoo group: n2adr-sdr
Date: 2016-04-12 18:57:26 UTC
From: MIKE DURKIN
Topic: 2145 Message: 2211

Did you try a sudo apt-get build-dep wsjtx before build of wsjtx ?

That might pull in ludev and what else it might need ..

To: n2adr-sdr@yahoogroups.com
From: n2adr-sdr@yahoogroups.com
Date: Tue, 12 Apr 2016 11:47:47 -0700
Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Sid - I finally got back to attacking this problem of having the wrong hamlib installed - been busy doing some woodworking.

I successfully (I think) removed the old hamlib-2 stuff and then re-did the installs, using your adjusted method. All was going along fine until it got to the part of building WSJTX. Below is a copy/paste of the ugly part. Any idea (1) what is ludev, (2) why it isn't found with the modified steps, (3) how to resolve the problem?......[94%] Building CXX object CMakeFiles/wsjtx.dir/Configuration.cpp.o[95%] Building CXX object CMakeFiles/wsjtx.dir/main.cpp.o[95%] Building CXX object CMakeFiles/wsjtx.dir/wsprnet.cpp.o[95%] Building CXX object CMakeFiles/wsjtx.dir/WSPRBandHopping.cpp.o[95%] Building CXX object CMakeFiles/wsjtx.dir/qrc_wsjtx.cpp.o[96%] Building CXX object CMakeFiles/wsjtx.dir/wsjtx_automoc.cpp.oLinking CXX executable wsjtx/usr/bin/ld: cannot find -ludevcollect2: error: ld returned 1 exit statusCMakeFiles/wsjtx.dir/build.make:987: recipe for target 'wsjtx' failedmake[2]: *** [wsjtx] Error 1CMakeFiles/Makefile2:1208: recipe for target 'CMakeFiles/wsjtx.dir/all' failedmake[1]: *** [CMakeFiles/wsjtx.dir/all] Error 2Makefile:137: recipe for target 'all' failedmake: *** [all] Error 2pi@raspberrypi:~/~wsjtx-1.7/build $

You have installed hamlib in $home/hamlib3/bin
What does "~/hamlib3/bin/rigctl -l | grep Peaberry" return?
I get nothing after running this, so I assume it found no hit on that word.

Possibly you still have the old hamlib packages installed -- "dpkg -S `which rigctl`"
"dpkg -l | grep hamlib" will list the packages, "apt-get remove <packages>" will get rid of them.
I ran a list of them and here is what it returned:

pi@raspberrypi:~ $ dpkg -l | grep hamlib
ii libhamlib-utils 1.2.15.3-2+b1 armhf Utilities to support the hamlib radio control library
ii libhamlib2 1.2.15.3-2+b1 armhf Run-time library to control radio transceivers and receivers
pi@raspberrypi:~ $

So - looks to me like the only thing I have is hamlib v2, correct? And if I do the "apt-get remove xxxxxxxxx" they'll be gone.

You are showing –prefix=/usr/local for the hamlib stuff. Sorry, but I'm confused - how will the hamlib files get installed into that location?

Jim

I chose "--prefix=/usr/local" so the binaries get installed in /usr/local/bin which is a regular PATH for executables.
73 ... Sid.

Sid - one of the questions I have is why I don’t have a Peaberry V2 entry in my Hamlib drop downs.

Yes, the WSJTX build is a pretty long process; I did it last week, several times! I used a procedure from Bill G4WJS. The hamlib part of it (done prior to the make of wsjtx), per his documentation was:

```
mkdir ~/hamlib3
cd ~/hamlib3
git clone git://git.code.sf.net/u/bsomervi/hamlib src
cd src
git checkout integration
mkdir ../build
cd ../build
```

../src/autogen.sh –prefix=$home/hamlib3 ……..> and then the same stuff as your

So, I’m wondering how I wound up with a version of hamlib that doesn’t seem to have the most recent list of rigs? How can I tell exactly what I’ve gotten by using the above procedures?

If I need to re-do hamlib and re-compile wsjtx, that’s no biggie, I feel pretty comfortable doing that now.

Jim / W6JHB

Oh, but I wish i could do that!!!! When I was using my SoftRock
Ensemble RXTX on my RPi2, that is exactly what I was doing, but I was
using the stand-alone WSPR2 software, not WSJT-X. So, I upgraded from
Wheezy to Jessie, put in a new RPi3 and opted to install the full
WSJT-X, so that I might try out JT65 and JT9 with the RPi.
Unfortunately, the version of Hamlib that I've gotten does not have an
entry in it for the OmniaSDR, or a Peaberry SDR, or any such sort of
thing. So, after several email exchanges with folks in this Yahoo
group and the Omnia Yahoo group, I reluctantly went the rout of having
Quisk as the intermediary between the SDR and WSJT. Not fun.

I would LOVE to figure out how to avoid this, as it has cost me untold
hours of grief and I am still not at the point where it is working
satisfactorily.

Sid - any help you may be in getting my 1.7.0-devel version of WSJTX
to work w/o going through Quisk would be greatly appreciated.

p.s. - I have no beef with Quisk - it is a great piece of software and
I do enjoy using it for QRPp CW contacts…

<mailto:w6jhb@...>[n2adr-sdr] wrote:

Just as an FYI, I’m using an RPi3 which has a bit more
horsepower than
the V2. But, perhaps that’s still not enough….

To my newbie eyes, this entire latency thing appears to be due to
having to use a loopback sink to get the audio tones back to Quisk
from WSJTX. Why do I say this? Well, with the following settings in
Quisk and WSJTX, receiving and decoding of WSPR2 signals works
great.
Very little latency, almost no choppiness in the audio to my
headphones:

Quisk: Digital Output = alsa:Peaberry Loopback PCM(hw:3,0)
Digital Input = alsa:Peaberry Loopback PCM(hw:3,0)

WSJTX audio Input = plughw:CARD=Loopback,DEV=1
audio output = plughw:CARD=Loopback,DEV=1

The above results in fine decoding, as I mentioned. But the audio
tones are not making it back to the OmniaSDR wen I press the Tune
button in WSJTX. Note that those selections are NOT the sink
loopback
that was suggested by Eric, WW4ET.

It sure seems that there ought to be some setting between these two
applications that would make the audio flow to Quisk for
transmit. If
we can’t figure this out, then using Quisk 4.0.4 and WSJTX
1.7.0-devel
for receiving and transmit on an RPi3 simply isn’t gonna
happen., and
I’ll be relegated to having a receive-only WSPR setup.

Any other ideas on this to avoid that latency-prone sink approach?

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Gentlemen - we have ignition and liftoff! Sort of.

I added a null sink and then put them into Quisk and WSJT-X. Lo and
behold, I can now receive and send WSPR2. That was the good
news. The
bad news is that there is a pretty large latency issue on the
receive
end. I'll do some reading and maybe play around with Quisk settings
to see if there are any tweaks I can make to fix this. Before
adding
the sink to Quisk there was almost no latency issue being reported.
Now it is pretty bad - I can hear really choppy audio in my
headphones.

Any suggestions?

Tnx, Jim / W6JHB

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

Eric, Mike, et al - turns out that Pulseaudio IS already
installed on the RPi - guess I was blind! I was hoping that I
could use the ALSA loop back as described on the Quisk web page;
I have it set per the documentation but no joy. So, it looks like
I've got to go with Pulseaudio. I "think" I have a null sink set
up and will attempt to get Quisk and WSJTX to speak to each other
that way. It's a struggle for me, as I'm most certainly a Linux
rookie, but I'm learning (slowly!).

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit Problem

I'm curious if ANYONE has been successful with Quisk
4.0.4 and FLDIGI and/or WSJTX? I'm doing it exactly as

documented on the Quisk web site. Neither FLDIGI nor WSJTX are having their audio picked up by Quisk with the setup this way. Those two applications ARE sending the audio tones out as they should, because when I tell them to send to the HW:0 device it hits my speakers just fine.

I can put screen shots of my configurations up on the group's file section, if that will help.

This whole thing is soooo close to working; I can send CW from Quisk, I have FLDIGI and WSJTX reading and decoding signals very well. What the heck is up with the transmit part?

Mike,

Everything on this RPi appears to be ALSA, not Pulse. Running pavucontrol only gives me the built-in audio output port on the RPI. When I run alsamixer, it shows all the ALSA devices, including the Loopback device.

On a recommendation from Bill G4WJS from the WSJTX development team, I changed WSJTX output to go to the default / system output: the speakers on my monitor. Doing that produces a nice clean tone when I press

the Tune button. So, WSJTX is sending a tone signal
out the door, but Quisk doesn’t seem to be hearing
it, or does not want to send it to the radio. It
sends the stuff from the radio over to WSJTX and
FLDIGI, but not the other way.

Wonder what else in Quisk needs changing?

Very strange.

Subject: Re: [n2adr-sdr] Quisk / WSJTX Transmit
Problem

you don't have the audio routing done right
....

Probably (maybe) but it isn’t obvious to me.

On Quisk I have the Digital Input and Digital Output both set to hw:3,0 and that’s what the Quisk doc sez. Over in FLDIGI, in the Configure—>Sound Card—>Audio—>Devices, I have both Capture and Playback set to hw:3,1.

Doesn’t seem logical to me, but this is the way the documentation sez to set it up. As I said in my original post, FLDIGI and WSJT-X can both receive and decode signals very well. Rig control works on both applications (frequency changes and T/R switching). I just don’t get either one to make the OmniaSDR send any output. I’m using two ways to see that: a second receiver (Elecraft K3) and a watt meter that has scales of 0-100 W, 0-1 W, and 0-100mw. When set at the mw level the needed never moves, so for sure no RF is coming out.\

If I set the OmniaSDR up for CW, it works just fine and produces a nice 1w signal, so it for sure can transmit with Quisk.

What else can be wrong??

Jim

Subject: [n2adr-sdr] Quisk / WSJTX Transmit Problem

OK guys, need some help here. I am running Quisk 4.0.4 on a Raspberry Pi3 with Jessie. My WSJT-X is version 1.7.0. Also have FLDIGI. My radio is an OmniaSDR. Quisk works great for me in CW mode by itself. My problem is with transmitting from either of those two digital applications.

I set up a Quisk Radio file per the online documentation where I am using XML-RPC in FLDIGI. I get decodes in PSK31 with no problem. If I press T/R in FLDIGI, the radio goes into transmit mode, but no RF flows.

In WSJT-X, I have it set up to use hamlib per the QUISK instructions. I get really great decodes in JT65, JT9, and WSPR-2. But, like with FLDIGI, pressing the Tune button in WSJT-X results in the radio going into transmit mode but no RF is generated.

Since both of those applications fail to generate a signal, I'm thinking I have something set wrong in Quisk, but I sure can't figure out where it is. As a side note, all aspects of rig control appear to work great in both applications - just can't get a signal out to my antenna!

Any hints would be appreciated.

Jim Bennett / W6JHB

Topic: 2145 Message: 2212

Mike, I just gave that a try and got:

E: You must put some ‘source’ URIs in your sources.list

Huh? What the heck is that?

From: Sid Boyce
Topic: 2203 Message: 2213

Hi Jim,
The only difference in building quisk on ARM is by replacing the codec2 libraries.
There are codec2 libraries for Raspberry Pi and ODROID but I chose to build and use codec2-dev from source.

Thanks again for the great work you do.
73 ... Sid.

FIXED! Needed to do two things. First, sudo apt-get update. Then, sudo apt-get install libudev-dev.

Thanks for the suggestion, now it's on to using the radio!

2215. QUISK with Afredri net

Yahoo group: n2adr-sdr
Date: 2016-04-13 05:05:18 UTC
From: Doug
Topic: 2215 Message: 2215

I would like to run Quisk with the Afedri receiver over the network. The Afedri works fine with SDR radio in Windows but since I am moving away from windows I would like to be able to use it in Linux.
My present system is Ubuntu 14.04 with the Mate desktop. I have been in contact with Alex at Afedri but I wanted to ask here for possibly clearer directions if possible. I downloaded the latest Quisk from the site - not Ubuntu repository and the files from the Afedri site for Quisk. I ran into some problems compiling the code for for Python.
Below is some of my dialog with Alex at Afredri. Has anyone done this in Linux or specifically Ubuntu 14.04, kernel 3.19.0-58-generic
gcc - 4.8.4

OK, I will run through that again. I think that is the way I did it. As in my first message I get compile errors when running the afe_library script which are not related to not finding something but rather source code errors. I am using the standard GCC 4.8.4 which is part of the Ubuntu 14.04 distribution -

```
 sudo ./afe_library
afedrinet_io.c: In function ‘afedri_read_rx_udp’:
afedrinet_io.c:229:4: warning: format ‘%i’ expects argument of type ‘int’, but argument 2 has type ‘ssize_t’ [-Wformat=]
    printf("read_rx_udp: Bad block size %i\n", bytes);
    ^
/usr/bin/ld: /tmp/ccW5teJV.o: relocation R_X86_64_32 against `.rodata' can not be used when making a shared object; recompile with -fPIC
/tmp/ccW5teJV.o: error adding symbols: Bad value
collect2: error: ld returned 1 exit status
```

Have you compiled this with Linux? This version?

Doug,
I am not proffesional Linux programmer, cannot give advice for every issue.
I can suppose that the *.so file that exists in afedrinet folder - was compiled on my PC and is not compatible with your distro...

I can recommend only in the beginning:
1. go to afedrinet folder and delete all *.so and *.pyd files
2. try to run afe_library script again.
Check your Python version (2.6 or 2.7 etc..) and which path used by python on your Linux distro.
Edit afe_library accordingly.
You ask me how - I do not remember.
Finally it must work
73!
Alex

Any help would be greatly appreciated.

2216. Re: QUISK with Afredri net

Yahoo group: n2adr-sdr
Date: 2016-04-13 07:40:20 UTC
From: alex@...
Topic: 2215 Message: 2216

Doug,
The fact that you can run SDR-Radio has no any connection to Quisk.

I have two important questions:

1. Have you installed standard Quisk package?
2. Can you run Quisk with sound card device?

You can begin with AFEDRI related installation only after first two steps are done and you can run Quisk with sound card device (by the way it will work also with AFEDRI USB connection too).

73!
Alex

2217. Re: QUISK with Afredri net

Yahoo group: n2adr-sdr
Date: 2016-04-13 16:14:57 UTC
From: dsc3507@...
Topic: 2215 Message: 2217

The reason I mentioned that both Quisk and Afedri work independently is to allay any questions about that. The Afedri works over the network fine and Quisk comes up and displays with sound input under Ubuntu.

The problem remains that the Afedri code will not compile. If I can't get this code to compile I cannot go any further. My question is has anyone gotten quisk to work with Ubuntu or any other recent Linux distribution and if so what was the process you used. If this code won't compile I can't get it to work. It seems the instructions are heavily geared towards the Mac but it says it works on Linux. Again my compile errors below....

```
doug@doug-Lenovo:~/quisk-4.0.5/afedrinet$ sudo ./afe_library
afedrinet_io.c: In function ‘afedri_read_rx_udp’:
afedrinet_io.c:229:4: warning: format ‘%i’ expects argument of type ‘int’, but argument 2
has type ‘ssize_t’ [-Wformat=]
printf("read_rx_udp: Bad block size %i\n", bytes);
^
/usr/bin/ld: /tmp/ccV3vgHt.o: relocation R_X86_64_32 against `.rodata' can not be used
when making a shared object; recompile with -fPIC
/tmp/ccV3vgHt.o: error adding symbols: Bad value
collect2: error: ld returned 1 exit status
```

And again... Ubuntu 14.04, Kernel 3.19.0-58-generic, gcc 4.8.4

So can I please hear from anyone running quisk with the Afedri in network mode on a Linux system?

2219. Re: QUISK with Afredri net

Yahoo group: n2adr-sdr

From: alex@...
Topic: 2215 Message: 2219

Doug,

I've just checked what is inside of afe_script on my Ubuntu 14.1 Linux

So you have to try to change the script according the error message recommendation: i.e. to add -fPIC to gcc compiler options:
so my Ubuntu 14.1 scripts look like:

```
gcc -o afedrinet_io.so --shared afedrinet_io.c ../is_key_down.c ../import_quisk_api.c
-fPIC -O3 -I"../" -I"/usr/include/python2.7/" -lpython2.7
```

73!

2220. Re: QUISK with Afredri net

Yahoo group: n2adr-sdr
Date: 2016-04-13 18:23:01 UTC
From: alex@...
Topic: 2215 Message: 2220

Doug,
It script sometimes have to be adopted to specific Linux distro, in your case, you can try next:

1. Try to run ./afe_library as user and not to use sudo (root) to run script as you do.
2. Try to do what error message recommends to you i.e. to add -fPIC to gcc compiler options:
so that scripts look like:

```
gcc -o afedrinet_io.so --shared afedrinet_io.c ../is_key_down.c ../import_quisk_api.c
-fPIC -O3 -I"../" -I"/usr/include/python2.7/" -lpython2.7
```

I successfuly compiled and running Quisk on any Windos, Linux and MAC OS X computer that I have at home:
Windows XP
Windows 7-64
Fedora 19
Ubuntu 14.1 64 bit
It is compiled and running even on ARM MarsBoard with Linux
MAC OS X El Capitan

73!
Alex

OK that fixed the error and the .so file was produced. There still is a minor? warning which I guess I can ignore. Shown below.

```
doug@doug-Lenovo:~/quisk-4.0.5/afedrinet$ sudo ./afe_library
[sudo] password for doug:
afedrinet_io.c: In function ‘afedri_read_rx_udp’:
afedrinet_io.c:229:4: warning: format ‘%i’ expects argument of type ‘int’, but argument 2
has type ‘ssize_t’ [-Wformat=]
    printf("read_rx_udp: Bad block size %i\n", bytes);
```

Alex,

OK all is fine and decoding. Very easy really just that hitch with the compilation.

Question - how do I change the sample rate? I have this in my config file .quisk_config.py

Nothing I seem to change here changes the sample rate from 740740. What am I doing wrong. Here are my current settings which are stock except for the IP address....

```
from afedrinet import quisk_hardware # Use different hardware file
use_rx_udp = 1 # Get ADC samples from UDP
rx_udp_ip = "192.168.0.82" # Sample source IP address
rx_udp_port = 50000 # Sample source UDP port
rx_udp_clock = 80000000 # ADC sample rate in Hertz
#rx_udp_decimation = 8 * 8 * 8 # Decimation from clock to UDP sample rate
#sample_rate = int(float(rx_udp_clock) / rx_udp_decimation + 0.5) # Don't change this
change this
data_poll_usec = 10000
#sample_rate = 192000 # ADC hardware sample rate in Hertz
sample_rate = 740740 # ADC hardware sample rate in Hertz
```

Doug,

Sample rate change is very simple:
Quisk has menu that allows to change sample rate press Config button and go to Config tab.

2226. Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-04-23 00:07:35 UTC
From: James Bennett
Topic: 2226 Message: 2226

Wondering if anyone has investigated the possibility of having Quisk write out an ADIF record so that QSO’s made with it can be input to a logging program? Or perhaps interface with a home-grown application that does that?

I ask because my main logging program is MacLoggerDX (MLDX) that runs on my iMac. I use Quisk 4.0.4 on a Raspberry Pi along with an OmniaSDR rig. After each QSO I’ve got to do the paper and pencil boogie to get my QSO’s logged into MLDX. Sure would be nice to have an ADIF created that I could haul into MLDX and get the job done.

I interface to my log program (CQRLog and Xlog for contesting) with Hamlib. I am a Linux user and don't know much about the mac but would be surprised if there is not a version of Hamlib for it.

I don't think the Mac is where I need hamlib - I use Quisk on a Raspberry Pi which runs Linux. And since I also have WSJTX installed on the RPi, hamlib is also there. So I guess I need to do some research and see HOW hamlib can be used to do what I want, with Quisk.

Hi Graeme,

Thanks for the info on your settings! Just to help my feeble brain get a handle on this, do you run both Quisk AND either one of these logging programs at the same time?

Hi Jim,

Yes that is right. Both my logging programs can control the frequency in Quisk and switch bands and modes. It also works the other way so If I change frequency, bands or modes in Quisk it reflects back into my log program. My log program also produces voice and CW signals so I can automatically call CQ etc. and this will drive Quisk also. I can run Quisk, the log program and wsjtx all at the same time.

I notice that in the recent versions of hamlib there is a dedicated N2ADR interface now which I have not tried but I expect that it may be better than using the generic network radio of type 2 as I presently do.

If your port number 4575 clashes with other software, Quisk allows you to change it.

If you are using Quisk to source cluster information, you can't use the same node for your cluster as your log does. Fortunately there are two nodes in ZL so I am OK here. You will have a ton of nodes in your area.

Hi again!

I looked at the web site for CWRlog and it looks like there are a couple pre-req apps I need, like MYSQL. I'm using a Raspberry Pi3 so it should be interesting to see if these apps will work on that platform. Hope they will!

Jim

2233. Quisk crashes with Pulse Audio - Bug Report

Yahoo group: n2adr-sdr
Date: 2016-05-08 22:02:28 UTC
From: gvjury@...
Topic: 2233 Message: 2233

I get infrequent crashes using Pulse Audio on Quisk. The system is very stable with Alsa but crashes on about one in ten sessions with Pulse.

The crashes seem to occur only while transmitting but it is possible that an Rx crash has occurred.

I am running a play latency of 50 mSec and a stream of 48k using pulse:hw:0,0 for mic and spkr.

It is occurring using SSB and I have only used Alsa with FreeDV and whisper so far.

I have run Quisk from a terminal and have captured the session ...

```
gvj@gvj-Mint ~/Programs/quisk $ python quisk.py

From: Eric Thornton
Topic: 2233 Message: 2235

Graeme,

Looks like you're using Mint. Do you know what version of Pulseaudio it is running? I rewrote the pulseaudio backend and in all my testing I haven't run into this error before. Are you using the latest version of Quisk?

On instances that crash, did the stream start/stop errors occur in a very brief time? Is the crash preceded by any erratic behavior or does it just "die"? Is "pulse:alsa_output.pci-0000_00_05.0.analog-stereo" a local playback stream or an outgoing IQ transmit stream?

I'm doing a little research as we speak to see where to look.

Yes it was very remiss of me to omit the pertinent information. Linux Mint as you guessed Eric and Quisk-4.0.5 Michael. My pulse info below ...

```
gvj@gvj-Mint ~ $ pulseaudio --version
pulseaudio 4.0

gvj@gvj-Mint ~ $ dpkg -l pulseaudio
Desired=Unknown/Install/Remove/Purge/Hold
| Status=Not/Inst/Conf-files/Unpacked/halF-conf/Half-inst/trig-aWait/Trig-pend
|/ Err?=(none)/Reinst-required (Status,Err: uppercase=bad)
||/ Name Version Architecture Description
+++-==============-============-============-=================================
ii pulseaudio 1:4.0-0ubunt amd64 PulseAudio sound server

gvj@gvj-Mint ~ $ uname -a
Linux gvj-Mint 3.19.0-32-generic #37~14.04.1-Ubuntu SMP Thu Oct 22 09:41:40 UTC 2015
x86_64 x86_64 x86_64 GNU/Linux
gvj@gvj-Mint ~
```

I mentioned a while ago that it would be good to have text screens on the config menu and here is a good case in point where it is helpful but I have included a screenshot of my audio from quisk.

I appreciate your attention to the problem guys and Eric you may be interested to know that Pulse works better than Alsa on my old laptop running on wifi using 802.11g with freeze and catchup about every minute or two but Alsa is every several seconds. I guess 802.11g does not quite have the speed. Not sure why Pulse works better as I expected the reverse.

Hi Graeme!

I finally got some time on the Raspberry Pi and..... got CQRlog installed and working with Quisk and my OmniaSDR rig. Seems to work quite well,with one exception - changing mode in Quisk does not change it in CQRlog. I probably have something set wrong in CQRlog and will do some more investigating on that later today. I also need to get FLDIGI installed. And then figure out how to route the JT65 and JT9 audio tones back and forth between Quisk and WSJT-X. So much to do, so little time.... :-

I set quisk digital to use snd-aloop ... problem is most times you have to build it into the kernel

For Rx using the monitor of quisk radio output works fine ... but for TX is a problem without the loop ... that I've been able to figure out by myself

I notice that in the recent versions of hamlib there is a dedicated N2ADR interface now which I have not tried but I expect that it may be better than using the generic network radio of type 2 as I presently do.

If your port number 4575 clashes with other software, Quisk allows you to change it.

If you are using Quisk to source cluster information, you can't use the same node for your cluster as your log does. Fortunately there are two nodes in ZL so I am OK here. You will have a ton of nodes in your area.

Yep, that's what I've been trying to do, too. I set up the alsa loop so it is started at boot time, but it is still not working very well. If I simply set WSJT-X audio to use the SDR directly it works great. But I've been told it is not good practice to do so; that the audio needs to be routed through an application like Quisk. Very frustrating.

The Pi might now have enough to do it all ....

Im set to 48Khz@16bit for the default pulse config .... and Quisk too ....

And if you used paprefs to put the audio stream on the lan .. undo that ...
you simply wont have enuff bandwidth for it all ...

Or its got to do with the new 64bit ubuntu and needs to mature some more
... not sure.

True for the old Pi model B, Pi 2 or P3 may be OK.
73 ... Sid.

2242. Re: [n2adr-sdr] Quisk crashes with Pulse Audio - Bug Report

Yahoo group: n2adr-sdr
Date: 2016-05-11 00:14:40 UTC
From: Sid Boyce
Topic: 2233 Message: 2242

Hi Graeme,
I hope to checkout TX tomorrow. The BGA616 driver failed and took out
the tracks so I built the replacement on a small piece of PCB with wires
soldered to components on the HiQSDR board.

I have had no problems on HiQSDR RX with a Pi model B (48K) then a Pi 2
(96K) and for 11 hours the ODROID-C2 (384K) all running quisk
auto-started on a 7 inch touchscreen so no startup messages.
Hermes-Lite runs quisk at 384K on a -C2 with a 7 inch touchscreen and
only the usual startup audio reports you also see but no failures.

Quisk on the -C2's configured for pulseaudio version 1:8.0-0ubuntu3 arm64.
73 ... Sid.

2243. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-11 00:17:18 UTC
From: James Bennett
Topic: 2226 Message: 2243

Well, on my RPi 3 something is sure amiss. Using the ALSA loop back I have no problem routing digital output from Quisk 4.0.4 over to either FLDIGI or WSJT-X. PTT works as does frequency control. However, I am unable to get audio from those two applications routed back to Quisk. The radio (an OmniaSDR) goes into transmit but no RF output. Frustrating.

2244. Re: [n2adr-sdr] Quisk crashes with Pulse Audio - Bug Report

Yahoo group: n2adr-sdr
Date: 2016-05-11 01:14:35 UTC
From: Eric Thornton
Topic: 2233 Message: 2244

The free() error appears to be related to trying to free a pointer that is not in existence. That means somewhere in the code, a memory address is being used in a way it shouldn't. The question, is if it is in the sound_pulseaudio.c module or in pulse audio itself. Things were pretty stable by pulse 4.0, but there could be a misconfiguration or driver issue making it crash. If you can rebuild quisk with the following line "python setup.py build --debug" it will include debugging symbols. If I remember correctly, after a crash you can type "gdb bt" and get the info I would need to dig further.

The other thing to test, is if the crash happens with a larger playback buffer.

I know this is an inconvenience,but if you're able to do so, it could help narrow the problem down.

Eric

2245. Re: Quisk crashes with Pulse Audio - Bug Report

Yahoo group: n2adr-sdr
Date: 2016-05-11 02:37:39 UTC
From: gvjury@...
Topic: 2233 Message: 2245

Hi Eric,

Thank you for checking this out and it looks like you are entering needle in the haystack territory. It is no problem to set up anything you request and I hope to get you some data soon.

Just a couple of questions. Do I need to do a make after the "python setup.py build --debug" or is that it?
The second is the buffer size set in code or a configurable parameter and if in code what file?

73, Graeme

Not sure if this is helpful but pulse did not exit cleanly when I shut down quisk ... gdb did not work for me but I have never used it before as I have been sheltered by Qt Creator environment and did not know where to go next. I really need to spend some time with Python as I have put all my eggs in the Qt basket.

```
gvj@gvj-Mint ~/Programs/quisk $ python quisk.py

Are you sure your using the loopback for audio that wsjtx is using ?

I just got wsjtx working on a C2 ... and yep ... loopback is not being routed properly ....

Im going to try to build the latest pulse and see what happens ....

2249. Re: Quisk crashes with Pulse Audio - Bug Report

Yahoo group: n2adr-sdr
Date: 2016-05-11 21:29:49 UTC
From: gvjury@...
Topic: 2233 Message: 2249

Had another crash but could not make sense of gdb so sorry but no useful info. I will have to spend some time on the documentation of gdb to find out what I am to do next after a crash so it may be a while before I can get you some info as the crashes are sporadic and can be a couple of weeks in between or sometimes every day.

2250. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-12 00:20:45 UTC
From: Michael Durkin
Topic: 2226 Message: 2250

Try this in order ....

Update pulseaudio to v8

Rebuild quisk and install

Rebuild wsjtx and install (or not install)

Run quisk and don't set digital to (hw:X,X) but use the pulseaudio names -
not alsa's -restart quisk if needed

Run wsjtx .... check wsjtx audio settings ...

Then run pavucontrol and verify qt streams have audio on them (recording,
playback will not show until wsjtx is set to tune)

I'm working with wsjtx TX now...

From: James Bennett
Topic: 2226 Message: 2251

Michael - been busy with some woodworking projects and haven't been able to devote time to this issue yet. But I do have a couple questions.

First - how can I tell what version of Pulseaudio is on my RPi 3? And how to get to v8 if I'm at a lower version - just do a sudo apt-get upgrade xxxxxx?

Second - why the need to re-build Quisk and WSJT-X? Do they not pick up the audio in and out "ports" at run time, based on profiles and settings?

You say you are working with WSJT-X TX now; you are saying that using Quisk, you are able to have WSJT-X do both transmit and receive?

Jim / W6JHB

From: Michael Durkin
Topic: 2226 Message: 2253

You can get the deb or a compressed gz to build and install .... probably a ppa added to your sources too ...

If you have the "software center" installed ... just search for pulseaudio and it will have the version installed listed.

2254. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-13 12:56:47 UTC
From: Sid Boyce
Topic: 2226 Message: 2254

"dpkg -l pulseaudio" will display the version.

If you are running a 64-bit OS on the Pi 3 you can recompile quisk as
64-bit or you can use the one compiled for the original Pi model B or Pi
2 which is backwards compatible.

In my case, the ODROID-C2 is running Ubuntu 64-bit so I have rebuilt
quisk to be 64-bit.
root@hiqsdr64:/home/odroid/Pictures# uname -a
Linux hiqsdr64 3.14.29-37 #1 SMP PREEMPT Tue Mar 15 23:57:29 BRT 2016
aarch64 aarch64 aarch64 GNU/Linux
root@hiqsdr64:/opt/quisk-4.0.5# file _quisk.so
_quisk.so: ELF 64-bit LSB shared object, ARM aarch64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=0649fe6c2a4b97eb565a06676ae6ad2e9ea6f264, not stripped
73 ... Sid.

When you build quisk .... on a 64bit platform -- do you need to tell it to build a 64bit version, or is it automatically done?
On May 13, 2016 5:56 AM, "Sid Boyce g3vbv@... [n2adr-sdr]" <n2adr-sdr@...m> wrote:

2256. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-13 15:36:11 UTC
From: Sid Boyce
Topic: 2226 Message: 2256

```
Absolutely no difference in building it on x86, x86_64, ARM 32-bit or
ARM 64-bit.
It is just another Ubuntu box.
"make" or "python setup.py install" uses whatever gcc and python is the
default.
root@hiqsdr64:/opt/quisk-4.0.5# gcc -v
Using built-in specs.
COLLECT_GCC=gcc
COLLECT_LTO_WRAPPER=/usr/lib/gcc/aarch64-linux-gnu/5/lto-wrapper
Target: aarch64-linux-gnu
<STUFF DELETED>
=aarch64-linux-gnu --target=aarch64-linux-gnu
Thread model: posix
gcc version 5.3.1 20160413 (Ubuntu/Linaro 5.3.1-14ubuntu2)

This is qt5 I built locally from git using the instructions under
ghpsdr3-alex - ODROID section.
root@hiqsdr64:/opt/quisk-4.0.5# /usr/local/qt5/qtbase/bin/qmake -v
QMake version 3.0
Using Qt version 5.6.0 in /usr/local/qt5/qtbase/lib
root@hiqsdr64:/opt/quisk-4.0.5# file /usr/local/qt5/qtbase/bin/qmake
/usr/local/qt5/qtbase/bin/qmake: ELF 64-bit LSB executable, ARM aarch64,
version 1 (GNU/Linux), dynamically linked, interpreter
/lib/ld-linux-aarch64.so.1, for GNU/Linux 3.7.0,
BuildID[sha1]=2b553f359cb8c1f2a404dc051416d81298770f5b, not stripped
73 ... Sid.

From: Michael Durkin
Topic: 2226 Message: 2257

OK .. i thought so, but wanted to make 100% sure ....

Hows the C2 for you sid?

Is its shutdown / bootup times always the same? ... some times mine will hand on shutdown for what seems like a few extra seconds to almost 2 minuets ... makes me wonder if the SdCard is not quite right ....

2258. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-13 16:49:03 UTC
From: Sid Boyce
Topic: 2226 Message: 2258

The -C2 is just great.

ODROID-C2 (2GHz, 2GB RAM, Gigabit Ethernet) vs. Pi 3 (1.2GHz, 1GB RAM, 100MBps Ethernet, Wifi) - no contest.
I could add a USB Wifi to the -C2 and get same or better performance.

Booting up is amazingly swift using the eMMC. On the second one I am using a Sandisk Extreme microSD card and that is not a great deal slower than the eMMC to the eye.
From clicking reboot ~20 seconds to full desktop with quisk automatically started using the microSD card.

The Sandisk Ultra suffered corruptions easily. When it was running it didn't seem to take much to upset it - do an update and it would refuse to reboot - so either an eMMC or a microSD such as the Sandisk Extreme ensures it's stable.

Ken (N9VV) is using his as a normal desktop, thunderbird email works but there is a problem with browsers. The forum suggests using firefox:armhf rather than firefox:aarch64 but I don't bother with browsers.

Everything else seems OK and fast.

I am still looking to hear good FreeDV. SNR RX levels are not good enough to copy a QSO.
I caught a couple of syllables rather than words on 14.236 yesterday.
73 ... Sid.

2259. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-13 17:36:30 UTC
From: Michael Durkin
Topic: 2226 Message: 2259

Iv only done in state qso with freeDv ... nothing long distance ...
500Miles max (what ever Seattle to Spokane is in distance) and only one day
before i gave it up ....

Is there a way to change quisk frequency remotely ?

Using paprefs to stream the soundcards was too much of a load ... with 2
cards on my odroid-X2 and 3 on the odroid-C2 made for a mess with snd-aloop
on both too ....

Or only have accessible cretin devices ... Id like to either run remote
desktop or have Quisk on the Odroid-C2 control Quisk on the Odroid-X2 ...

2260. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-13 20:16:35 UTC
From: Sid Boyce
Topic: 2226 Message: 2260

That is still a successful freeDV QSO.

With QSD/QSE like Softrock/UHFSDR I don't know there is a way.

With DDC/DUC where the rig is on the LAN, quisk can be run from anywhere
to it as the rig is just another device on the network.
73 ... Sid.

2261. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-14 22:32:53 UTC
From: James Bennett
Topic: 2226 Message: 2261

Sid and Michael -

well, that was an interesting process (sudo apt-get upgrade); took several minutes and updated/upgraded several packages on my RPi3, but the end result is my having the same version of Pulseaudio as before: 5.0-13

Is there a magic trick to getting Pulseaudio v8, or is this because I am NOT running Ubuntu, but rather Raspian Jessie?

Jim / W6JHB

From: Michael Durkin
Topic: 2226 Message: 2262

If you add theppa for pulse audio dev , you should have v8 ....

Though I'm not 100% convinced that if you rebuild quisk .... ie

Make
Sudo python setup.py install

You should get quisk & wsjtx to work ...

Are you using jtsdk to install wsjtx?

No, I compiled hamlib-3 and wsjtx using Bill Somerville’s instructions. It is wsjtx v1.7.0-devel

Most likely Raspbian is not at current level but I used
ubuntu-mate-15.10.1-desktop-armhf-raspberry-pi-2.img on my Pi 2.
I only ever had a problem with pulseaudio version 1, from version 2
onwards it has been solid on all platforms including Pi 1 with
2015-02-16-raspbian-wheezy.zip.
73 ... Sid.

Kinda what I was trying to get at .... should work without v8 ....

Once it's up to date with packages ... try rebuilding Quisk ....

From: w6jhb@...
Topic: 2226 Message: 2266

Sid, Michael, and Others -

Well, I've completely updated/upgraded the Raspberry Pi Raspian Jessie, downloaded and compiled the most recent Quisk (4.0.5) and tried a few different output devices in WSJTX with various input (capture) devices in Quisk. I get either no transmit, or a hung up Quisk I looked in pavucontrol while WSJTX was doing its transmit, but got no hints there. Getting close to giving up and simply using WSJT-X as a receive-only application on the RPi.

In case you want to help pursue this a bit further, I've taken several screen shots of settings in Quisk and WSJT-X and posted them in a photos album in the group. If you see anything that jumps out and might help to try, please let me know.

Tnx, Jim / W6JHB

Iv said it before .. don't use the (hw:X,X) listings ... just the ones that
you see listed under pulseaudio on the soundtab ---

"Loopback Analog Stereo" is one that i see in your screen shot ....

and reduce the samplerate's to 48000 till you get all working ...

From: James Bennett
Topic: 2226 Message: 2268

Well, that got it - sort of.

I changed the input and output in Quisk and WSJTX to use that Pulse thing. The good news: the WSJTX audio output is now being routed to Quisk and then gets sent to the OmniaSDR where it is converted to RF and out my coax. The bad news: the latency is so bad that nothing decodes on the WSJTX main window. I can see traces being printed, but no decodes, probably due to the latency. Listening to it on the headphones I can hear the audio stuttering. So the bottom line is this isn't a workable solution. The Raspberry Pi CPU utilization is less than 60 percent, so the processor is certainly not overloaded. Any idea how to resolve this ugly choppy audio? It ain't working like this!!! :-)

Oh - forgot to mention - changing the samplerate to anything other than 96000 isn't feasible - I believe the SDR requires it, and if I change to 48000, Quisk freezes up.

Jim

Yes,

The rig is internally set to 96000. Setting the host application to
anything other than 96000 will not work.

If the quisk sample rate is set to 48k, then check the default linux sample rate and specify a default sample rate of 48k@16le (or s16be if on a 64bit system)

If you can't find what conf file has that I can get it off of my sdr .... I just don't remember where it is located off hand ... I'm trying to do college school work.

i usally

sudo gedit /etc/pulse/daemon.conf

down at the verry bottom un rem (remove the #) from

default-sample-format = make this s16le for now --increase untill studder
is back then reduce
default-sample-rate = 48000

From: Eric Thornton
Topic: 2226 Message: 2273

Pulse right now will only do 16 bit or float. Other sample depths get converted by pulse/sox on the fly which would kill the cpu on rpi. 16 is a safe bet. Native 24 is in my to do list.

Jim, it sounds like you're playback buffer needs to be increased. I have gone as high as 500ms over the network with no missed wspr decodes. For local, 100ms should be a good compromise. Let me know what they're set at. It sounds like you're close.

2275. Re: [n2adr-sdr] Quisk / ADIF Output?

Yahoo group: n2adr-sdr
Date: 2016-05-19 03:03:53 UTC
From: James Bennett
Topic: 2226 Message: 2275

Eric, Michael, and other interested parties,

I think, after weeks of head scratching and frustration, I have finally gotten the combination of Quisk and WSJT-X to work properly on my Raspberry Pi 3 with the OmniaSDR rig. Interestingly, the thrust of this thread has morphed considerably from what it started out as. Gee, what a surprise, eh?

This week's "experimentation" involved changing the names of the digital input and output in Quisk and WSJT-X to match the Pulse names, as Michael had urged. That resulted in being able to transmit in WSJT-X but some introduced really ugly latency. So bad that no decodes were happening. Eric suggested some changes to buffering. So, I played around with two settings in the "radio" panels, rather than in my quisk_conf.py file. Here is what I wound up with that allows good decoding with a moderate amount of latency/audio skips:

Play latency = 150 msec
Hardware poll usec = 500

The radio has been running WSPR2 on 20 and 40 minutes for the past six hours, with transmit percentage at 20. Lots of decodes (receive and transmit) from all across the USA, and I fully expect to see a bunch of JA, BG, VK, and ZL spots on 40 meters during Friday morning gray line

Thanks for everyone's help in this process!

73, Jim Bennett / W6JHB
Folsom, CA

Getting close to giving up and simply using WSJT-X as a receive-only application on the RPi.

2276. Using new FreeDV Modes in Quisk ?

Yahoo group: n2adr-sdr
Date: 2016-05-23 07:53:45 UTC
From: dh5ym@...
Topic: 2276 Message: 2276

Hi all,

recently the new modes 2400A and 2400B were introduced for VHF communication.
I followed the Readme in the Freedvpkg directory of Quisk and recompiled. Now i can select the 2 reserved mode buttons and if i TX in Loopback mode (full duplex, FDV) i see a spectrum that looks somehow like what i would expect.
Different than for 700/700B and the 1600 mode i do not get decoded audio in the new two modes via the full duplex mode. I wonder if something else needs to be changed too ? Maybe someone can give some hint if i am doing things correct or wrong.

regards
Mario, DH5YM

2277. Re: Using new FreeDV Modes in Quisk ?

Yahoo group: n2adr-sdr
Date: 2016-05-25 08:45:17 UTC
From: dh5ym@...
Topic: 2276 Message: 2277

Yesterday i had another try and on the second view the TX signal seems also odd in the new modes. The spectrum looks rather noisy and there is really no decode (also not text message) in FDV mode.
I assume i miss something and further changes to the Quisk code are required to get it working.

2278. Quisk, Afedri SDR-Net and Raspberry Pi - audio problem

Yahoo group: n2adr-sdr
Date: 2016-06-01 22:23:05 UTC
From: rwklein@...
Topic: 2278 Message: 2278
Attachments: 2 described; binary payloads are missing from this source WARC

I've compiled Quisk 4.0.5 for my Raspberry Pi 3, and I'm using the default config for the AFEDRI SDR-Net. I've got it running, but have very garbled sounding audio. The messages from Quisk indicate some kind of problem with the audio, and the Status screen indicates lots of audio errors.

I'm a bit of a newbie at this...any idea how to fix this? I've verified that audio works on the Pi 3 itself.

I've attached snapshots of the Status and Sound tabs from Quisk. The output from Quisk is shown below.

Thanks,

Roger N5RWK

```
pi@raspberrypi3:~/quisk $ ./quisk.py

Most all that start with ALSA can be ignored ... they are produced when Alsa is being probed. ...

You need to make a new radio file rather than use the default ... as I understand it.

From: Michael Durkin
Topic: 2278 Message: 2280

After the new radio of type alfredi is made ... reduce the sample rate to 1/4 of what you have ....

Have you changed the default pulse file to reflect the size and bit depth you want? .... I always start with 48khz and work my way up in size / depth in steps till things quit working ....

2281. Re: Quisk, Afedri SDR-Net and Raspberry Pi - audio problem

Yahoo group: n2adr-sdr
Date: 2016-06-02 01:15:40 UTC
From: rwklein@...
Topic: 2278 Message: 2281

Michael,
Appreciate the info! Being new to this, I'm not quite sure what you mean by creating a new radio file...what I did was create a .quisk_conf.py file in my /home/pi directory using the generic configuration supplied on the afedri-sdr.com site. Quisk picks this file up when it starts.

I did some playing around, and discovered that the audio device specified in the generic configuration isn't right for the Pi3. Surprised I got any sound at all, considering. After perusing the docs I figured out the right sound device, and Quisk is working perfectly now with the Afedri - no audio errors show up (other than at the beginning when sound is being probed) and the sound is quality is great.

If anyone runs into this, here's the functioning .quisk_conf.py file for the Raspberry Pi 3. The only change I made from the generic configuration from the afedri-sdr.com website is the name_of_sound_play item - I changed it from "portaudiodefault"#hw:0,0" to "alsa:bcm2835"#hw:0,0".

Now to install WSJT-X and see if I can pick up some WSPR beacons :-)

Regards,

Roger N5RWK

```
# .quisk_conf.py file for AFEDRI SDR-Net
#
from afedrinet import quisk_hardware # Use different hardware file
use_rx_udp = 1 # Get ADC samples from UDP
rx_udp_ip = "192.168.0.1" # Sample source IP address
rx_udp_port = 50000 # Sample source UDP port
rx_udp_clock = 80000000 # ADC sample rate in Hertz
#rx_udp_decimation = 8 * 8 * 8 # Decimation clock to UDP sample rate
#sample_rate = int(float(rx_udp_clock) / rx_udp_decimation + 0.5) # Don't change
data_poll_usec = 10000
sample_rate = 740740 # ADC hardware sample rate in Hertz
playback_rate = 48000 # Radio sound play rate
name_of_sound_capt = ""#AFEDRI-SDR-Net Audio" # Soundcard capture device
name_of_sound_play = "alsa:bcm2835"#hw:0,0" # Use same device for playback
#name_of_sound_play = "Line 1"#Virtual Audio Cable" # Use same device for playback
latency_millisecs = 50 # latency time in milliseconds
display_fraction = 0.92 # edges of full bandwidth are not valid
default_rf_gain = 14
# Select the default screen when Quisk starts:
default_screen = 'WFall'
```

2282. Re: replay recorded IQ-Samples into quisk

Yahoo group: n2adr-sdr
Date: 2016-06-02 03:57:57 UTC
From: n7ihq.jim@...
Topic: 1730 Message: 2282

I wanted to use a IQ file input for Quisk also. The following approach worked for me:

Load the ALSA loopback module:
Edit the /etc/rc.local file, add modprobe snd-sloop
In the Quisk radio sound configuration:

I/Q Sample Input: hw:Loopback,1
In a terminal window execute:
aplay -D plughw:Loopback,0 <file.wav>

2283. SNDP IP address allocation problem

Yahoo group: n2adr-sdr
Date: 2016-06-06 09:10:41 UTC
From: dlrn36@...
Topic: 2283 Message: 2283

Hi all,
I've had a HIQSDR for a few years now and I have loaded James's firmware version 1.4. To date using the stock IP address was OK but I need to connect to rest of my home network and tried the SNDP to allocate a new IP to the radio.

Is it correct to state the the SNDP process will only work on the same subnet, ie the radio is programmed with the default of 192.168.2.196 and so SNDP will only be able to allocate out a 192.168.2.xxx subnet address ?

I ask as this appears to be the way it works. I was hoping to change my ip address from 192.168.2.196 to a 10.0.0.xxx address without having to reprogram the firmware.

However all attempts fail with the discover request discover response handshake repeating over and over and the software doesn't progress to the discover set message.

I modified the quisk_conf.py parameters to allocate out a 10.0.0.15 address with the following:
rx_udp_ip = "`10.0.0.15"
rx_udp_ip_netmask = '255.255.255.0'
rx_udp_port = 0xBC77

I didn't need to do anything else did I? Do I need to change the netmask do achieve what I'm after? Or is my statement above correct, it only allocates within the same subnet?

Thanks
Greg

2284. Help with CW transmit & CAT on Quisk with Win7 PC

Yahoo group: n2adr-sdr
Date: 2016-06-06 19:39:50 UTC
From: bob6wire@...
Topic: 2284 Message: 2284

I'd like some help in getting my Peaberry SDR (equivalent to the Omnia SDR) to transmit CW using the Quisk software package on a Windows 7 PC.

I've been able to get receive working well, the images are nulled and the frequency is accurate and tunable from within Quisk. If I select the FM mode and click on PTT in Quisk; I can then send CW (transmitter RF output - no sidetone obviously) with a key plugged into the Key jack on the radio. If I enable sidetone, I can generate a tone when in CW mode while PTT is selected but I can't generate any CW keying of the sidetone or transmit RF output while in CW mode.

I can send crude CW with HDSDR software but I'm unable to find any other software that I can successfully send CW with. I'm sure this is a lack of understanding on my part.

A second difficulty I'm having is setting up CAT with Quisk. The only references I can find are to TCP/IP port numbers while the Logger32 logging software I hope to use outputs CAT to a serial (COM) port.

My attempts to study the Omnia files, firmware and Quisk manuals and instructions have not revealed my mistake.

If someone can provide specific information on what configuration parameters are required, I would really appreciate it.

Bob, AF5Z

2285. wifi bandwidth and Quisk/HiQSDR

Yahoo group: n2adr-sdr
Date: 2016-06-09 09:04:04 UTC
From: gvjury@...
Topic: 2285 Message: 2285

Hi Group,

I have an old Dell E1505 laptop which I like to use for a remote SDR computer. Although very old it easily supports Quisk and HiQSDR over ethernet but not really well over wifi. I think the problem is that 802.11g is simply not enough bandwidth and causes the radio to run perfectly for about 2 or 3 minutes then it seems to scramble the audio for 10 or so seconds and again run for 2 or three minutes.

I have set the ...
play latency to 300 mSec
Graph refresh rate is set down to 3
FFT size multiplier is set to 0
Radio and mic are run at 48000

Are there any buffers I can increase the size of or any other suggestions? It is winter here now and my lounge is a lot warmer than the shack. I guess I could string an ethernet cable into the lounge but that is the last of the last resorts.

Hi Graeme,

300ms latency should be more than sufficiend. I usually run my HiQSDR via WLAN with about 150ms.
Could it be that you have some other trouble with the WLAN ? Maybe a interference every 2 or 3 minutes or some data loss here and then ? I would use a ping in parallel in order to check for problems with the network.

regards
Mario

Hi Mario,

Great to hear from you and your very good advice.I will try ping in the morning (nearly midnight now) with an ethernet connection and then compare it with the wifi. I have had 2 different wifi routers with the same result so I don't think it is the router itself but I will start from scratch and suspect everything.

Danke sehr,

Graeme

Unfortunately I didn't get the time I hoped today to look at the problem but did come across some interesting things.

To access 192.168.2.196 across my subnets I use a fixed IP address and set a netmask of 255.255.252.0 which allowed me to see the HiQSDR board. Today I tried to use "sudo route add 192.168.002.196 dev wlan0" and seemed to have fewer dropouts this way but still some. Another issue is that the IP address did not stay in the table through a reboot and has to be loaded each time. I sure would like to know if there is a way to make it sticky.

Using pulse audio rather than alsa also gave a better result which surprised me

ping using the ethernet was better
rtt min/avg/max/mdev = 0.080/0.099/0.143/0.026 ms

while wlan0 gave
rtt min/avg/max/mdev = 0.536/1.593/70.518/5.401 ms

Will get back to the problem in a couple of days.

Graeme,

I stream 96khz 16 bit stereo IQ over my wifi all the time from my soft rock SDR. It works great with pulseaudio, but I have no experience with the Hermes boards and their UDP protocol.

My results are better with 2.4ghz vs 5ghz. The most important thing is to have consistent ping times... If every 10th ping is 100ms, then you're going to have issues. If you're seeing inconsistent ping times, then start trying to figure out why. Look for other devices on your network, or look if you're using a channel that may overlap with a neighbor of yours. Some wifi cards will give a SNR reading if you look hard enough.

The Quisk pulseaudio backend will silently discard any samples that "overfill" the buffer. I found this to happen frequently over my wifi connection and resulted in latency issues. It also doesn't start playback until the buffer is full. This gave me good results but I haven't spent much time looking at the alsa code to know why it might be performing worse.

Hi Eric,

Thanks for your response and in particular the information that it can work for you at 96 KHz 16 bit. My modem won't allow separate 2.4 GHz settings and runs in auto mode where it switches depending on its receiving from 802.11 b/g/n. I can manually lock it to 802.11g where it sets to 20 MHz bandwidth at 2.5 GHz but there is no performance difference. I live out in the country and have virtually no neighbours to conflict with my channel selection although I have tried changing to a couple of different ones with no change.

My ping times are not very consistent although unfortunately the time from HiQSDR is truncated so I can't see if audio dropout coincides with an inconsistent ping time and all I can get is the summary when I exit which shows min/avg/max/mdev. On ethernet connection it is quite consistent with a deviation of around 0.01 mSec.

Off topic I still get a crash on Quisk with pulse audio but have not had a good chance to look deeper into it. I need to get more familiar with running debug as my attempts would not allow Quisk to run so I am obviously doing something wrong.

From: jahlstr@...
Topic: 2291 Message: 2291

Quisk can now display and tune multiple sub-receivers if your hardware has them. It currently works with the Hermes-Lite hardware. Push the Help button for documentation. You can tune sub-receivers to different bands and modes, and play audio from any of them.

You can select different color schemes from the Radio/Font configuration screen.

I added code to speed up the display of configuration pages when the Config button is pushed. I changed the VNA program shutdown messages.

For users of the HiQSDR, I added sample rates of 1536 and 1920 ksps. These are 16-bit samples, and require recent DL2STG firmware.

2292. HiQSDR tx power level

Yahoo group: n2adr-sdr
Date: 2016-07-02 13:15:11 UTC
From: Mario Illgen
Topic: 2292 Message: 2292

Hi there,

I'm using a HiQSDR with preselector and MPPA 10 W amplifier. I'm puzzled about tx output power.

In QUISK I have configured 120 as maximum tx level. Depending on the slider for tx level I get the following values (15m band):

100% 13 watts
50% 12 watts
30% 12 watts
20% 11 watts
10% 6 watts
5% 2 watts
0% 1.5 watts

Is this a normal behaviour?? I'm measuring with a Diamond SX-600 (20W and 5W range) into a dummy load. The wattmeter is probably not the best but the tendency is interesting..

Thanks for any information..

Topic: 2292 Message: 2293

Hi there,

to answer my own question: I probably operated the HiQSDR amplifier to hard with a max tx level of 120 resulting in a output power of 13 watts. The amp is specified with 10 watts. When I reduce the max tx level for an 100% output of 10 watts (which was a value of 30 for me) the percentages are looking much better.. :-)

As I've got the initial values from config file examples which I found on the internet I still wonder where the differences come from..

Thanks and 73
Mario, DL3LSM

Hi Mario,

the 100% level you need to set depends on the modifications you applied to the board.
Did you look through the modifications of the PA documented on the HiQSDR webpage ?
30 appears a bit low to me. For what band is this value ?

regards
Mario

Hi Mario,

the value was for 15m.. Did not try the other bands so far..

I bought the HiQSDR used and have done no modifications myself. I had to send it back to Helmut at some point and asked to do all modifications. But judging from the low value it seems that the tx range is not modified. I have to check the other (lower) bands as well..

Thanks and 73

2297. Re: HiQSDR tx power level

Yahoo group: n2adr-sdr
Date: 2016-07-08 17:40:27 UTC
From: dh5ym@...
Topic: 2292 Message: 2297

Hi Mario,

the values appear to be very low to me.
Thats what i have in my config (PA board without modification for flat output power response):

that was the original assembly of the TRX PCB:
#tx_level = {None:255,'160':170, '80':120, '40':105, '30':80, '20':48, '17':60, '15':60, '12':40, '10':110, '6':255, '60':90} # Adjust your power for each band

That was the setting after the modifications of the TRX PCB suggested on the HiQSDR page:
tx_level = {None:255,'160':170, '80':120, '40':105, '30':110, '20':70, '17':110, '15':110, '12':110, '10':140, '6':250, '60':90, 'TRV':230, 'TRV2':90} # Adjust your power for each band

So i wonder why you have 10W already with that low scaling.
Maybe someone else can share his settings too ? Mine are probably not the best since i assembled my boards on my own completely.

regards
Mario

Hi Guys,
This group has gone silent on the subject of HiQSDR for years it seems.

I built mine Standalone using the Raspberry Pi 1 model B as can be seen
on my QRZ.com page, upgraded to a Pi 2 and now an ODROID-C2.

I didn't connect the rotary encoder/switch control via Arduino Uno
modified for +3.3V operation as the later SBC's seem to offer an
all-in-one solution but I was not able to convert the Arduino code to C.

The HiQGPIO mentioned below never surfaced either.

Is there any HiQSDR development still taking place?

Hi Sid,

Yes it is the same for me. I watch eagerly for a post to this group but it rarely happens. The regular progress with Quisk seems to be all that is happening. Contrasting this with the action on Hermes and other ddc/duc projects it certainly seems to have stalled. I wonder if with a large amount of the innovation coming from Germany that language may have been a barrier, I know how difficult it is for me trying to translate German documents with Google. I use HiQSDR as my main everyday rig and the VNA is one of the most important tools in my shack.

Hi Graeme,
The excuse offered back in July of 2014 was that they were very busy and promised to deliver a schematic for the Arduino.
That was the last I heard from them.
I eventually figured out from DL2STG's gpio.tgz.

I saw one very advanced transceiver being developed that used the 10W HiQ MPPA, can't remember the name or find the URL. It did say a prototype was built.

I forgot to ask the guys visiting the Friedrichshafen show this year to seek them out and report on what they are currently working on.

Dear all,

Helmut and Stefan were very busy with the R2T2 web-based transceiver project of the DARC.
You can find some information here:
R2T2-Wiki http://r2t2.de/index.php?title=Hauptseite

http://r2t2.de/index.php?title=Hauptseite

R2T2-Wiki http://r2t2.de/index.php?title=Hauptseite Inhaltsverzeichnis 1 R2T2 - Multiuser SDR Transceiver with WEB-Interface 2 Die Schaltungsauslegung des R2T2 3 Hardware & Leiterplatte des R2T2 V2.01...

View on r2t2.de http://r2t2.de/index.php?title=Hauptseite
Preview by Yahoo

There is an Yahoo group for that as well.
Since the hardware has settled now and a few are qrv already Helmut has some time in the future maybe.
Stefan implemented an SPI slave into the FPGA image. I never tried that so far but he uses it with some controller to attach rotary encoders to his transceiver.

Personally i prefer to use my HiQSDR as a blackbox and just control it via PC. Therefore the SPI / GPIO has never been on the priority list before. I would like to use it for connecting external equipment like SWR and power meter for example.

regards
Mario, DH5YM

Thanks Mario,
The R2T2 is it - I couldn't remember the name so I could find it on my PC's and I couldn't find it via google searches.

I was very impressed by Stefan's standalone HiQSDR. I used his firmware and originally the Pi 1 model B but held off connecting the ATMega328 to support the encoders/switches as more recent SBC's are more than powerful enough to support the SDR app and GPIO.
SBC's with a small touchscreen, a few encoders and switches that frees me from the need of a desktop or laptop has great appeal.

I now use quisk in preference to rasdr as it supports Digital Voice (FreeDV).
73 ... Sid.

Yes indeed. I also prefer Quisk to other SDR software since it has very nice features. I regulary use it in VHF/UHF/SHF contest.
About FreeDV: I still search for my first FreeDV QSO. Maybe we can arrange a sked somewhen.
Did you manage to get the 2400A/B mode working as well ? I put in the new library and it seems to be set by Quisk but i it seems there is no valid TX spectrum and i also do not get self-decode in loopback mode.

regards
Mario

I listened for quite a while on 14.236 some months ago but never heard anything.
Now the bands are open I must do some more listening.

Graeme (ZL2APV) has made a few QSO's with VK using HiQSDR and quisk.
From what I gathered, he spent a lot more time listening.

I had several qso in sept 2015 with AA3GZ on 20m freedv/quisk, but the quality was really poor, I heard PA0HWB on 80 m but could not get a report from him...Too poor activity to say if this mode has an interest.

Worth keeping a watch on over time to see if matters improve.
Activity is bound to be low because it's not a standard mode on
commercial rigs and the number of owners of SM1000's are typically
experimenters and relatively few.

Besides, the guys seeking FM broadcast quality audio on HF would
instantly recoil in horror.
The previous wars of transistors vs. valves (tubes) and SSB vs. AM would
seem mild by comparison.

2309. Clock on main GUI

Yahoo group: n2adr-sdr
Date: 2016-09-19 18:15:08 UTC
From: dan.tiganas@...
Topic: 2309 Message: 2309

HI all,
Is there a way to add the clock on main display? I am running Quisk full screen on Raspberry PI LCD and it would be very helpful to have the current time displayed.
Thank you very much!

Michael,

Are you running on a raspberry pi? What audio device are you using?

When you say latency changes, do you mean that with pavucontrol running you see increasing latency or is it inconsistent?

pavucontrol opens additional streams to the audio device and then down-samples using speex I believe. This will most certainly put additional load on the processor.

Let me know if that helps explain the phenomenon or if something else is going on.

Im using an Odroid-X2 ... Ubuntu 14.04

The I/Q USB device is a Via1620A set to 48000@16bit (i think native is 96000@24bit)

When pavucontrol is not running when quisk starts i get audio "pauses" .... when pavucontol is running i can set the latency_delay fairly low ... last time i changed it -- it was set to 50ms.

Im using the quisk_conf.py because iv never been able to get any version of the GUI setup to have good latency -- usually not working or horrible pauses.

Im getting angry with Odroid -- their Kernel version is getting OLD. 3.8 for the X2 (still) and 3.14 for C2 (and im starting to think this is an issue -- im also trying to get Direwolf to work with the audio streams)

As as side question ... im wondering if anyone with SBC (arm) is using Ubuntu16.04 and can Tx ... reply in a separate thread if you do.

I ran into this when I was debugging the new pulseaudio backend, but can't quite remember the details 100%.

By chance are you running anything else like wsjtx? If I remember correctly, the way wsjtx connected to pulse audio with qt, it failed to set the stream properties and there were some buffer issues. I thought I put a workaround in for that. Let me know if this is the case.

2319. Quisk Version 4.1.2 October 2016

Yahoo group: n2adr-sdr
Date: 2016-10-19 13:37:08 UTC
From: jahlstr@...
Topic: 2319 Message: 2319

This contains a new version of the Quisk Vector Network Analyzer program quisk_vna.py. The VNA program works with the Quisk hardware and the HiQSDR. I replaced the correction logic, added a new Calibrate screen and improved the formatting.

I added a feature to change the Quisk waterfall colors on the Fonts configuration screen. The new colors were provided by David Fainitski. Thanks David!

Jim

2320. quisk ver 4.1.2

Yahoo group: n2adr-sdr
Date: 2016-10-20 00:44:13 UTC
From: gvjury@...
Topic: 2320 Message: 2320

Hi Jim,

Again thanks for the enhancements to Quisk and the VNA is working beautifully for me. It is more stringent in enforcing me not to use levels that clip and I can now see the result of running with a certain amount of clipping vs no clipping with high levels not being as flat as some clipping would lead one to believe. It also seems to me that the performance above 30 MHz is improved and I seem to have less random noise at low levels there.

I think there is a bug in Quisk when the 500k band is selected as it is not possible to tune and keep the band button selected. It works fine for 137k so I am using that for my broadcast band selection.

I should have my Rx Hi Pass filter board back from Elecrow any day now so your VNA enhancements could not have come at a better time. Many thanks for the generous gift of your time and considerable talent Jim.

Hello Graeme,

When I tried the 500k band it started with VFO zero. I will add some defaults for the 137k and 500k band. When I set the band edges on the Config/radio/Bands screen and entered a starting frequency in the frequency entry text box, everything worked. Note that the last frequency will not be remembered if it is outside the stated band limits. If you want to use 500k for the broadcast band, try setting the edges to 0.5 to 1.6 or so. If something still does not work, please state the problem again.

Thanks for your many contributions to the Hermes Lite project.

2323. Re: quisk ver 4.1.2

Yahoo group: n2adr-sdr
Date: 2016-10-20 21:53:03 UTC
From: gvjury@...
Topic: 2320 Message: 2323

Hello Jim,

This is a really strange one and I think it may be to do with the defaults table. The issue is that after setting up the band edges to 0.5 and 1.8 with Tx Level = 0 and IO Bus = 0, plus bands selected are 500k to 6 i.e. 12 bands plus audio and time. When I start Quisk and select 500k it opens with vfo zero and when I roll the frequency up and reach ~ 140 kHz (my sample rate is set to 48 kHz) the band button deselects and although I can tune up to the broadcast band of course there is no button selected so the settings cannot be remembered. I tried exiting with the 500k button selected and 130 kHz showing on the dial but it restarted back at vfo zero. It seems that it thinks it has audio selected when the 500k button is selected.

Just tried something else and now it works. I set up Quisk for pulse and set the 500k band in that radio and it worked. I then tried my original alsa radio and it also works so I don't know how it happened but again think it may be to do with the quisk_settings.json file. Any way I will keep using Quisk and report if I get any more problems with the 500 KHz band. It seems strange that the 137k band worked and the 500k band did not.

Thanks for your time Jim,

73 Graeme

Hi Mike,
SoapySDR runs plugin modules built for it which seem to be SDR hardware specific.

The current modules are listed at
https://github.com/pothosware/SoapySDR/wiki/PythonSupport
It doesn't list any modules for the hardware that quisk supports and if it did it wouldn't need quisk.
73 ... Sid.

2325. First time user - quisk ver 4.1.1

Yahoo group: n2adr-sdr
Date: 2016-10-21 01:57:34 UTC
From: Robert Nickels
Topic: 2320 Message: 2325

Hi Jim, all -

I'm just starting out with Quisk on a Raspberry Pi 3 with the aim of running my Hermes-Lite.

A couple of weeks ago I downloaded version 4.1.1 and found the Hermes files but got things messed-up while trying to understand how the configuration feature works. So tonight I deleted everything started fresh by re-extracting from the tarball, but when I try to launch Quisk I get the following:

```
pi@raspberrypi:~/Downloads/quisk $ python quisk.py
Traceback (most recent call last):
File "quisk.py", line 34, in <module>
import _quisk as QS
ImportError: ./_quisk.so: wrong ELF class: ELFCLASS64
```

Remembering that 4.1.2 had just been released I tried it, but still get the same error above when launching with the default configuration. It seems to be a 32 vs 64 bit issue - the OS on the Pi 3 is 32 bits. I was able to run Quisk before and nothing has been changed other than deleting and extracting, so I'm not sure how to fix this.

Thanks for any assistance,

73, Bob W9RAN

No prob ....

are you using the Pi3 or Pi2 ?

With Pulseaudio or port or alsa?

Oh .. that's right , you have a Hermes-Lite.

Yes, here's a screen cap showing the nice low CPU utilization on the Pi 3 (48 kHz bw): http://i.imgur.com/fd0CWd2.jpg

I'm using the default audio to the audio output jack on the Pi, which is alsa. Want to try Bluetooth audio next.

By the way the H-L is on a wired segment but the Pi 3 is connected via wi-fi and I'm running Quisk remotely from an old XP box using Xming. As can be seen I've also got a browser and several terminal windows open as well. I'm impressed both with Quisk and with how it runs on this platform.

2333. TX on Hermes-Lite

Yahoo group: n2adr-sdr
Date: 2016-10-23 01:46:39 UTC
From: Robert Nickels
Topic: 2333 Message: 2333

After spending half the day playing with Quick running my Hermes-Lite in receive mode, I have to say "I love it!" Thanks Jim and friends for the excellent work on this, my only regret is not discovering it sooner.

One thing I've been scratching my head over is transmit mode. My H-L has no PA yet but I know it will put out 50mW or so by using another control program - yet when I put Quisk into transmit mode it's the sound of silence. I've got a working mic and mic level is set as verified by the record/playback feature (which is very cool by the way) and everything else is at the default setting including all the IP-related settings for the H-L and the TX Level slider is set to 100%. But when I key the PTT in SSB mode, I can't hear a peep on the TX frequency and haven't found anything else that could be preventing TX output. I assume the default IP and port settings should work.

When I click the PTT or trip the VOX, the PTT button turns red and the Rx display stops - but that's all. Is there supposed to be anything on the spectrum display while transmitting?

I'm probably missing something - thanks in advance.

Hi Bob,

Check the config screen choosing the radio you have set up and go to band
and check the tx levels are not zero. Sorry am away in my caravan and can't
help with alsa settings by relying on memory.

2335. wxversion error

Yahoo group: n2adr-sdr
Date: 2016-11-04 00:16:37 UTC
From: Robert Nickels
Topic: 2335 Message: 2335

I keep getting the following error when trying to select a radio that I've created, or when I try to start quisk with python quisk.py.

```
import quisk as QS
File "./quisk.py", line 25, in <module>
wxversion.ensureMinimal('2.8')
File "/usr/lib/python2.7/dist-packages/wxversion.py", line 181, in
ensureMinimal
raise AlreadyImportedError("wxversion.ensureMinimal() must be
called before wxPython is imported")
wxversion.AlreadyImportedError: wxversion.ensureMinimal() must be called
before wxPython is imported
```

I had this problem a week or so ago and thought I solved it by recompling, but that no longer is the case, and recompiling has no effect.

I understand that wxversion is supposed to help the application run with the correct version of python if more than one is installed. Mine is Python2.7.9 and everything on the system has just been updated. What is odd is that if I select the Hermes-Lite as the Radio, everything works fine, no wxversion issues.

Thanks for any help understanding what's going on here and how I might fix it.

Thanks but it does the same thing. However through persistence if not programming skill, I managed to fix it. The error was happening on line 8 so I compared with other hardware control programs and found that line 8 in the H-L version has an underscore before quisk e.g "import _quisk as QS" rather than "import quisk as QS" as mine was. Making that change seems to make wxversion happy.

The only way to do this currently is to specify a config file on the command line, and have several config files for different modes.

For help on command line options, use "python quisk.py -help". Check the config screens after Quisk starts to make sure you got what you want. You need to be using "ConfigFileRadio".

It is the older config file style. Here is an example:

python quisk.py -c myconfigfile.py

python quisk.py -c myotherconfigfile.py

There is also an option for a second config file, so you can put common configuration in the first file, and use the second for slight changes. Here is an example:

python quisk.py -c baseconfigfile.py --config2 specialmode.py

I've had similar errors when the wrong sound playback device is selected in the HL "Sound" tab (the one under HL not the quisk sound tab that you posted). Make sure the "Radio Audio Output" device is set to the correct output device and that the other parameters are correct.

I've seen this problem most often when playing with Bluetooth speakers. It works OK until the Bluetooth speaker is turned off and quisk is restarted which produces an error because the specified device is no longer present. Sometimes it's necessary to start with -a option and choose the "ConfigFileRadio" option to obtain access to the Config editor. Hope this helps.

2344. Quisk Version 4.1.3 December 2016

Yahoo group: n2adr-sdr
Date: 2016-12-09 21:41:59 UTC
From: jahlstr@...
Topic: 2344 Message: 2344

The VNA program quisk_vna.py now works with either the Hermes hardware or the HiQSDR hardware. The quisk_vna.py program is part of Quisk. You need Hermes-Lite firmware 32 or above to use VNA.

I added some defaults for the 137k and 500k bands. These bands are experimental, so be sure to set the lower and upper edge on the Config/Radio/Bands screen and follow the rules for your country.

If you set the TX Level for a band to zero, the PTT button is grayed out for that band. This is a visual reminder not to transmit on that band.

Something I had wondered about for a long time but was afraid to ask Jim knowing how busy he is.

There is support for the Powermate in ghpsdr3-alex/trunk/src/QtRadio/{powermate.cpp, powermate.h}.

I also have one looking just pretty on a bookshelf. It could be very useful as there is already powermate support in recent kernels.

Not included in 3.14.79-96 for the ODROID-C2 and gizmod doesn't build.

Hi Sid,

thanks for the reply. The reason that I asked was indeed the support for QTRadio.

Here my powermate is also collecting dust. ;-(

I can use it as scolling device under linux and in that way it is usable in Quisk. But it should be nice if it has its own hook into Quisk as tuning device.

When there is a possibility to set a special seperate input (pointing) device for tuning, in the config-file, it should also be very easy to use a mouse or trackball as tuning device.

In linux you can maken a udev rule to separate the extra pointing device from the standard pointing device. So the powermate or extra mouse/trackball could be on the /dev/tuning "mountpoint"

2349. My changes to QUISK

Yahoo group: n2adr-sdr
Date: 2017-01-16 23:00:41 UTC
From: rolin791@...
Topic: 2349 Message: 2349
Attachments: 1 described; binary payloads are missing from this source WARC

Hi, people.
I learned the Python for a few weeks and thanks to this I was able make useful changes in my favorite programm - the QUISK.

What I have done:

1) Changed the principle of calibration S-meter, now S-meter is tied to the scale of decibels, then there's now indications decibels are correct.

In addition, the value considers also an attenuator / amplifier, so that the C-meter always shows the correct level of the signal given to the antenna input.
Calibration is performed as before, specifying the required value correct_smeter parameter in the configuration file, either from your radio in the program menu. The only difference - the calibration value is now given in decibels rather than in S-scale values.

2) Added a CAT control system that is compatible with the instruction set of the transceiver Kenwood TS590S.
Supports setting mode, frequency, state of the transmit / receive in both directions, from the log in Quisk and from its to the log.
For the COM port settings, write the following lines in the config file:
#CAT settings, defaults parameter speed 9600, Parity - none, Stopbits - One, bytesize - 8,
#Commands in according to TS-590S by Kenwood
CAT_port = 'COM10'
CAT_DEBUG = False
You will also need an additional package for Python called pyserial, you can easy find and install its, ask to Google.

This port allows you to control of the RX/TX(PTT) only using CAT commands.

3) Added an additional port to control the RX/TX(PTT) and CW manipulation from a logger. To configure adding the following line in the config file:
#PTT to QUISK trough CTS, CW to QUISK trough DSR (RTS and DTR signals on other side of virtual #cabel)
PTT_port = 'COM12'

PTT_DEBUG = False
In CW mode, except for the PTT control, it is possible to form the CW using the program itself. Unfortunately, at this time, the signal is not formed rise / fall, so use this option only for testing.

4) Added automatic level control when drawing the waterfall. Also, applying a special formula to calculate levels by which a waterfall drawn much better. Slider Yz, as usually, controls the brightness, slider Ys controls of contrast of the image.

5) Fixed a bug when zooming panorama expressed in incorrect display of the panorama, when zooming, when the filter is close to the edge of the pan. This mistake had to be corrected,

as it disrupts the automatic adjustment of the waterfall.

6) Added an ability to toggle the three available palettes waterfall with the hot button right on the fly. Three variants of palettes, as you know, are available in your Radio options in this version of QUISK, where you can adjust how the palette will be enabled by default.

In order for this function to work, you must assign a hot key in the configuration file:

```
# Waterfall palette control key
hot_key_pal = ord('P')
```

You can change the color palette also in the configuration file, the first palette has a name
waterfallPallette, second and third waterfallPalletteB and waterfallPalletteC.

To make use of the changed program, install as usual the Quisk of version 4.1.3 and replace quisk.py file from C: \ Python27 \ Lib \ site-packages \ quisk on the same file from the archive. The archive also contains my configuration files, which you can use to easily start if it is needed. Put both files in the My Documents folder.

Enjoy with the QUISK !

Best regards, David Fainitski

Hello, Nik What OS are you using ?
I tested under Windows, Python 2.x.x , with Odyssey, HiqSDR works good also.

Try use the new file and don't use PTT_port settings in your config-file.

Write me errors, I will to resolve them.

Best regards

Done, but no change.

> What OS are you using ?

Mint Linux 17.3 64 bit
Python 2.7.6
Softrock Ensemble RXTX

It looks like your quisk.py is incompatible with the Softrock hardware.

Quisk hangs - traceback attached.

Hello, Nick

No, quisk.py is universal file for all the hardware, all platforms.

The problem in your quisk_hardware.py file, it don't contain rf_gain parameter and my version didn't conside this fact. Try new version

Hello David. (rolin)
Just tried quisk.py, if I start quisk with ./quisk program responds with permission denied, if I use python ./quisk.py it works Ok.
 Not a problem, just for information.

The permissions on the file are probably not executable.

#chmod u+x quick.py

Hi Linux gurus.

I have read through the “My changes to Quisk”. Will this means I can copy the attached rar file and copy the text into my quisk.conf file and then have CAT on my HIQSDR?. I will use my HIQSDR as second receiver so I can listen to tow different antenna system between the SUNSDR PRO and the HIQSDR.
I will then use the CAT function to synchronize the two radios frequencies.

RX works more than fine except for control of the Si570: I can only receive around the wakeup frequency of the Si570.

I've written the recommended SYSTEM=="usb",ATTR ... into etc/udev/rules.d/99-softrock.rules

(as well as a copy in the subfolder local.rules).

Is there some new issue with the Pi3?

Sorry for the delay--- I was in Xenia. My Quisk is 4.3.1. The usb- related items in the quisk_settings.json all look right but one:

usb product I'd 0x05dc
Hamlin port. 4575
usb vendor I'd. 0x16c0
Si570 direct control. False. (????)
Si580 i2c address. 0x55
hardware file type. SoftRock USB

Are there other entries that control the 570?

Shame that this last hurdle remains since the radio's performance is extremely good otherwise.

The only thing that looks suspicious is the Si580 unless it's a typo and
you meant Si570.
You could also try setting Si570 direct control to True.

With my Softrocks I have uses USB BitWhacker and SDR-Widgets for many
years instead of the ATTiny chips.

Ok ....

You should not need to set permissions for the USB buss .... maybe.

Since usbsoftrock is changing freq ... all is working , just a minor hickup.

Try first running quisk as sudo ... not sudo su

But

Sudo quisk or

From built main folder .....

Sudo python quisk.py

If not working, try setting direct controll to yes ... restart quisk.

If still not working ... well explore some with usbsoftrock (it's been awhile since I used it so I have to refresh my memory)

Excellent! Running Quisk as su works (after setting up a config file as before). I now have full control of the Si570 and all works as should.

So there is some USB permission trouble as ordinary user? I don't have that problem with usbsoftrock.

2381. Re: [n2adr-sdr] Re: Quisk with RPi3 has no USB control of Softrock Ensemble RX II

SOLVED! In the Configuration under the Ensemble II radio I am trying to setup, the line "hardware path" is filed in by choosing radios of softrock type as "./quisk_hardware_model.py", which is misleading at the very least.

When I run under su, that line is auto filled as "softrock/hardware_usb.py"

That is the correct entry when not su as well.

I now have a complete radio. Thanks to you all.

"python setup.py install" is an alternative.

Permissions:- Mode="0666" in 99-softrock.rules also sets them and
creates /dev/softrock..

Copy and paste the next to /etc/udev/rules.d/99-softrock.rules
---------- CUT

SUBSYSTEM=="usb", ACTION=="add", ATTR{idVendor}=="16c0",
ATTR{idProduct}=="05dc", MODE="0666", GROUP="dialout", SYMLINK+="softrock"
---------- CUT

2385. No TX I/Q audio is being sent to the Software RXTX

Yahoo group: n2adr-sdr
Date: 2017-05-27 01:39:10 UTC
From: maccluer13@...
Topic: 2385 Message: 2385

My Softrock RXTX is performing nominally (under HDSDR) on both RX and TX. However, with Quisk, although the receiver functions flawlessly, the radio will not transmit.

The issue is simply that no matter what sound card is assigned to send TX I/Q audio from the RPi3 to the radio (during PTT), no audio emerges from the sound card. (The Softrock PTT voltages are being keyed correctly by Quisk.)

What Quisk software switches must be thrown to change a RX Ensemble into a RXTX?

2386. Re: [n2adr-sdr] No TX I/Q audio is being sent to the Software RXTX

Yahoo group: n2adr-sdr

My Softrock RXTX is performing nominally (under HDSDR) on both RX and TX. However, with Quisk, although the receiver functions flawlessly, the radio will not transmit.

The issue is simply that no matter what sound card is assigned to send TX I/Q audio from the RPi3 to the radio (during PTT), no audio emerges from the sound card. (The Softrock PTT voltages are being keyed correctly by Quisk.)

What Quisk software switches must be thrown to change a RX Ensemble into a RXTX?

I think --- HDSDR is Windows.

Should have read below.
with quisk running, check if pulseaudio is running and the status under
"fuser -v /dev/snd/*"
It could also be audio settings:-
lin_microphone_name
lin_name_of_sound_capt
73 ... Sid.

Make sure HDMI sound is disabled ....

Are you using plughw: or just plain hw: for the designator?

########################## reply ##########################

Yes, the radio is changing over. I get output if I apply an external audio generator to the "line out" jack of the Softrock.

I am indeed using alsa.

I did use headphones --- nada.

HDMI is disabled. (The receiver plays beautifully.)

I use fragments of the descriptor for the sound card, for instance "alsa:SB X-Fi"
for a Sound Blaster X-Fi Surround sound (SB 1095). These fragments work fine
for receive and Quisk displays their full names.

Yes, HDSDR is under Windows. I mentioned that to assure everyone that the Softrock was completely operational.

alsa should be fine.

lin_microphone_name should point to the same sound card as
lin_name_of_sound_play -- for Mic and speakers.
"lin_name_of_mic_play" should point to the card that connects to the
RXTX Line Out.
Designators for alsa shoulde be:-
"hw:0" # First sound card
"hw:1" # Second sound card, etc.
"plughw" # plug device
"default" # alsa default device

Check with alsamixer to make sure Mic is not muted (MM) or set too low.
If it's muted M will unmute it.
73 ...Sid.

Please post your ~/quisk_settings.json.

Snip out all the band edge and band labels stuff.

Nick:

Thank you very much. It took only about 10 minutes to set up Quisk on Windows, where everything worked gangbusters.

With the Linux I erased the .quisk_config.py and the psy, then recompiled everything. Once reset up, the result was the same: RX but no TX.

I'll try your settings today. I assume you mean to change these in .quisk_config.py, not default

You can make the suggested changes through the GUI, which in turn
changes the settings in quisk_settings.json.

You should never need to make manual changes to ~/quisk_settings.json,
and I would not advise doing so.

It is very easy to break the syntax so that quisk completely ignores the
file. Of course you can just delete it and a new one (populated with
defaults) is created the next time you start quisk.

I only use ~/.quisk_conf.py where I need to change the default settings
in quisk_conf_defaults.py and there is no GUI support.

You should not make any changes to quisk_conf_defaults.py.

As always back up your configuration before making any changes.

Nick:

Success!

I started over: erased .quisk_config.ps and the quisk_settings.json, then recompiled. Then modified the json file as you suggested. Oddly, the Sound Blaster SB-1095, unlike in the Windows version of Quisk, cannot serve as both RX capture and TX I/Q out---its TX output is very weak. When I switched to the onboard Kuman PiFi DAC+ for TX, all was ideal---full output of 1.5 watts.

However, CW does not work. Do you know if Quisk supports the paddle input of the Softrock RXTX?

Thanks you for your help.

It is very easy to break the syntax so that quisk completely ignores the
file. Of course you can just delete it and a new one (populated with
defaults) is created the next time you start quisk.

I only use ~/.quisk_conf.py where I need to change the default settings
in quisk_conf_defaults.py and there is no GUI support.

You should not make any changes to quisk_conf_defaults.py.

As always back up your configuration before making any changes.

> I started over: erased .quisk_config.ps and the quisk_settings.json, then recompiled. Then modified the json file as you suggested.

You did not need to recompile. Did you use the GUI to configure those settings as I suggested? If you edited quisk_settings.json directly then erasing it and starting from scratch was probably a good idea. If possible make all changes through the GUI; do not edit quisk_settings.json directly

> Oddly, the Sound Blaster SB-1095, unlike in the Windows version of Quisk, cannot serve as both RX capture and TX I/Q out---its TX output is very weak.

Sounds like the problem is that the TX drive is low, not that you cannot use the SB1095 for both RXIQ and TXIQ. Try using alsamixer to set the TX level for the SB1095.

> When I switched to the onboard Kuman PiFi DAC+ for TX, all was ideal---full output of 1.5 watts.

The maximum rated output of the SR is 1W. Above that level the out-of-band spurious emissions increase rapidly. Suggest you limit the level of the TX IQ signals at the "Line-Out" connector to 0.7V rms i.e. 2V pkpk. I use a scope to set mine.

> However, CW does not work. Do you know if Quisk supports the paddle input of the Softrock RXTX?

Yes it does; I use it all the time. When you press the key both the SR and quisk should go to TX. Semi break-in CW operation.

Does PTT work on SSB?

Does the SR go to TX when you press the key? Check with a scope.

Does quisk go to TX when you press the key?

Is there any TX IQ audio coming out of quisk on CW? Check with a scope; On TX you should see an audio tone on key down.

2407. Ground-loop isolator makes huge difference in Softrock TX with RPi3 + PiFi

Yahoo group: n2adr-sdr
Date: 2017-06-02 21:11:47 UTC
From: maccluer13@...
Topic: 2407 Message: 2407

I have a Softrock RXTX under Quisk running on a Raspberry Pi3. The TX transmit I/Q audio is supplied by the piggyback Kuman PiFi Digi DAC+, which is otherwise a good unit. However, when used with the TX there is a ground loop that severely increases received noise (by > 10 dB).

With the addition of the $7 Vodool from Ebay http://www.ebay.com/itm/302266695807 http://www.ebay.com/itm/302266695807 the receiver floor returns to the level (-130 dBm) when the TX line is unplugged.

Great product.

2409. Quisk Version 4.1.7

Yahoo group: n2adr-sdr
Date: 2017-06-06 19:29:06 UTC
From: jahlstr@...
Topic: 2409 Message: 2409

This version merges all Hermes Lite 1 and 2 features with the regular Quisk distribution. There is no longer a need for a special Hermes Lite version. If you have a Hermes Lite 2, please use the latest firmware with version 40 and up. The extra data windows and settings for HL2 will appear when using HL1, but will be invalid. I will fix this when everyone updates to the latest HL2 firmware.

Robert, DM4RW contributed a bug fix for CW. Thanks Robert!

From: keith.bellairs@...
Topic: 2411 Message: 2411

Getting my new softrock rxtx going. Is there a cookbook set of instructions?

My setup is as follows:
Ubuntu 16.04 O/S
Pulseaudio to an on MB 7.1/5.1/... soundcard
wsjtx 1.7.0
Quisk 4.1.3
line in/lineout/USB to softrock rxtx

The SR rig receives fine. And when I press Tune in wsjtx I see energy on my ant (a whole watt). But I am concerned that the output of wsjtx is going to line out which is the same place I am sending Quisk play radio sound and play mic sound. It feels like that cannot be right. But it seems to be the only way for me to get output.

Is there a file with directions to help?

Keith,

No need for the snd-alsa loop. Pulseaudio is great for this type of routing between programs and radio program output. I have a setup on my old page http://km4dsj.wordpress.com but that is with an older version of quisk that used the old quick_conf.py file. It's also way more complicated than your case since the pulse audio backend has been rewritten since. However, the principle should be the same with the new setup. You can also use the program "pavucontrol" to see where your streams are going. You can also move the streams between programs, even if the program selected a non desired output. It's definitely useful.

My soft rock rig has been sitting in a box for the last 6 months and quisk is not installed on this laptop right now, otherwise I could be of slightly more help.

Here's where I am so far.

snd_aloop was a great hint. The alsa loop is full duplex. I am trying to make pulseaudio work with new "sinks". The digital out from quisk would be a sink and the output of quisk would be a sink. Pulseaudio sinks are half duplex - one way. So the quiskoutput sink is picked up in wsjtx by quiskoutput.monitor. And the wsjtxoutput sink is read by wsjtxoutput.monitor in quisk digital_in. (Of course it takes a few setup commands to create the non-default sinks.)

So this approach works 100% for fldigi. For wsjtx it works 50% - wsjtx input is configured to connect to quiskout.monitor and works like a charm. The output side of wsjtx is connected to "fldigiout" (It's just a name; it's just a sink for the wsktx output.) When wsjtx tries to transmit I see a blip on my power meter to the ant, and then nothing. Somehow a configuration that works FB for fldigi fails for wsjtx. I have to figure out what's different. (And not break fldigi.)

Eric - took a look at your blog page. That's amazing. It will take me some time to understand what's going on there. But I do plan to move my softrock to rpi one of these days. First things first - I want to get back on the air.

here are the commands I am using to configure pulse:

```
pactl load-module module-null-sink sink_name=quiskout
pactl load-module module-null-sink sink_name=fldigiout
pacmd update-sink-proplist quiskout device.description=quiskout
pacmd update-sink-proplist fldigiout device.description=fldigiout
pacmd update-source-proplist quiskout.monitor device.description=quiskout.monitor
pacmd update-source-proplist fldigiout.monitor device.description=fldigiout.monitor
```

Then use pavucontrol to be sure quisk and wsjtx are configured to "do the right thing/"

I had some success with Alsa loopback. I frequently use it to attach a CWSkimmer which runs under wine. With pulseaudio i usually have the problem that it resamples to 48kSpl/s internally which i do not like.
I also used to connect FreeDV via Pulse in the past but usually connecting it to the "Monitor of ...".

2417. FreeDV in Quisk

Yahoo group: n2adr-sdr
Date: 2017-06-09 19:57:01 UTC
From: Robert Nickels
Topic: 2417 Message: 2417

One of the neat features of Quisk is the inclusion of FreeDV mode. I had this working several months ago but getting it going was an arduous process (which I've subsequently forgotten!) and after recently re-installing and updating to Quisk 4.1.7, the FDV button is enabled in my config file but is again greyed-out and not available. The same codec2 is present as before and other than Quisk nothing else was changed, but it sure isn't coming up working as it's supposed to. The OS is Raspbian Jessie v8.

I'm wondering if anyone might have some tips to help restore the FreeDV mode?

Thanks and 73,
Bob W9RAN

Check the libraries in freedvpkg directory are for the platform.
Jim normally includes x86 libraries.
I usually replace them with the ones from the previous quisk version
which I originally copied from the ones I built and installed in
/usr/local/lib

e.g:-
root@hiqsdr64:~# file /opt/quisk-4.1.7/freedvpkg/libcodec2.so.0.6
/opt/quisk-4.1.7/freedvpkg/libcodec2.so.0.6: ELF 64-bit LSB shared
object, ARM aarch64, version 1 (SYSV), dynamically linked,
BuildID[sha1]=071033215ac0e0694d626a418e766ec101b1bbf5, not stripped
73 ... Sid.

2420. Problem with quisk and fldigi

Yahoo group: n2adr-sdr
Date: 2017-06-13 19:48:37 UTC
From: Dr. Karsten Schmidt
Topic: 2420 Message: 2420

Hallo,

I hope somebody can help me or point me in the right direction.

I’m using the combination of quisk and fldigi since about 2 years without problems, I’m using the alsa loopback configuration as described on http://hiqsdr.com/index.php?title=HiQSDR-Digitalmodes and everything went well.

But for some months I have the problem, that fldigi doesn’t work reliable anymore. It’s quite difficult to decode PSK31 signal with fldigi. Monitoring the signal, it sounds like short interruption (even no noise) of the signal. Switching back to USB or LSB it sounds to me normal, without the described short interruption. Checking the status pane in the config window I can see errors in for the “Play radio sound” and “Play digital mode sound”. In less than 5 min I have more than 400 errors. Furthermore, I see increasing latency values and switching them back to zero with an interval of about 2 seconds. This effect corresponds to the missing sound. In the SSB-mode everything is fine. I’m running ubuntu 16.04 with kernel 4.8.0-54-generic. I also tried different quisk versions.

Anny hints?

Kind regard Karsten

It's a intel hardware (Intel Core i7-2860QM (2.50GHz)). So it's should not be a cpu problem :-)

To be honest, I hesitate the reinstall the laptop and sometime I will have got a new kernel automatically. So, it would be nice to understand the real problem.

May need more buffering in ~/.asoundrc.

From: nick
Topic: 2417 Message: 2424

What is the passband ripple on TX DGT-U 4800 Hz bandwidth?

I am using wsjt-x and quisk 4.1.7 and am seeing some variation in output between tones well away from the edges of the passband.

2425. Quisk API?

Yahoo group: n2adr-sdr
Date: 2017-06-14 19:24:26 UTC
From: Ron
Topic: 2425 Message: 2425

Hi,

Just a bit of background first. My very small company sells a couple of SDR transceivers. Currently our go to host application is HDSDR. I have created a rather extensive DLL to support our hardware. HDSDR has a rather good API and is fairly well documented. A GUI has also been created that interfaces with the DLL to provide a number of features that HDSDR does not provide (calibration, tune function and a few other things).

HDSDR <-------> DLL <-------> Rig
|
GUI

I am investigating providing Quisk as second host application for folks who are not particularly fond of HDSDR.

So my question is, does Quisk provide an API such as this? I have reviewed the Quisk documentation (briefly) and nothing really jumped out at me. If it does not have an API such as this, what needs to be accomplished to provide something similar to what has been mentioned?

NOTE: We do not charge for host applications. We simply provide them as a convenience.

Hallo

I found a way to switch back to an old kernel (4.4.0-79). Then it works smoothly without any error. That’s funny, that means there is a problem in the new kernel 4.8.0-54 regarding the “alsa” or “loopback” device…

Lots of questions…

The simplest question… How to collect useful information for a bug report?

Quisk is writen mostly in python with some c++. Look at the other transceiver blocks for documentation and examples.

Do you have a link to what kind of SDR you have? Direct or I/Q ?

Like the red pitya? Si570 lo?

Sounds like you could just modify the ensemble (softrock) file .... use a pe0fko firmware ... or hamlib?

From: jahlstr@...
Topic: 2435 Message: 2435

This version adds a bandscope screen for the Hermes Lite. It uses the raw data from the ADC to display a 36 MHz wide view of the spectrum. You do not need to update to this version unless you have Hermes hardware.

Trying to transmit from wsjtx to quisk to softrock. I can see that I am generating a tone going into the quisk microphone input. But no IQ Tx output to send to the softrock. Must be some kind of newbie mistake, but it seems like I have tried every possible variation on config.

Using pulseaudio in Ubuntu. 2 soundcards. IQ in and out connected to onboard card. Radio output and mic in thru USB card.

PAVUControl shows wsjtx signal on the mic input. But nothing on IQ Tx. Any help?

Topic: 2436 Message: 2438

A couple ways too do this, but i think the easiest (and most reliable) way to use this configuration is to create a null sink in pulse audio. There are lots of instructions out there on how to do this. I named mine "dig-out" or something similar. You'll automatically get "dig-out.monitor" after restarting the sound server. Then, configure quisk to use that monitor stream as it's mic input or direct it there with pavucontrol.

Some folks set up a loop device in alsa, but i prefer allowing pulseaudio to handle the audio and keep latency predictable. I focused on this method when i rewrote the pulse audio backend a couple years ago.

Hope this helps.

Enable snd-aloop and use tjat ad a virtuial soundcard to route ....

If on arm it might not work tjat way and another soundcard might need
installed with a physical connection to your microphone/speaker

Hi Eric,

I think I've tried this. Created a null sink and used pavucontrol to link the output of wsjtx to the mic input of quisk. In pavucontrol when I press Tune in wsjtx, I see a strong signal being received in the mic input of quisk. But no output in the IQ transmit channel directed to my softrock.

Some setting in my quisk is refusing to trigger PTT and turn on the output.

Michael,

When I couldn't get pulseaudio to work creating a virtual soundcard, I bought a USB card so that I could run 2. I get the same problem with it - I can see input to quisk in the mic input but nothing comes out for the IQ transmit.

nick,

"lin_digital_output_name": "",
"lin_name_of_sound_capt": "pulse:alsa_input.pci-0000_00_14.2.analog-stereo",
"lin_digital_input_name": "",
"lin_name_of_mic_play": "pulse:alsa_output.pci-0000_00_14.2.analog-surround-51",
"lin_name_of_sound_play":
"pulse:alsa_output.usb-C-Media_Electronics_Inc._USB_Audio_Device-00.analog-stereo",
"lin_microphone_name":
"pulse:alsa_input.usb-C-Media_Electronics_Inc._USB_Audio_Device-00.analog-mono",

This is just one of several broken configs I have tried. Notably here I tried to set the mike input to the mic channel on the USB soundcard, but pulseaudio does not see it to allow it to be connected as the output from wsjtx. So this is really broken.

Does the digital input and output make a difference? I have tried with and without. With digital input set I do pass the sound on to wsjtx, just as the radio output does. I was guessing that using digital input just gets around the audio passband filtering. If you use digital input and output do you need 3 soundcards?

Do you have a sample of a config that works?

So there's a lot I am not understanding.

You need to create a loopback between wsjtx and quisk. These settings
won't do that.

>
> Does the digital input and output make a difference? I have tried with and without. With digital input set I do pass the sound on to wsjtx, just as the radio output does. I was guessing that using digital input just gets around the audio passband filtering. If you use digital input and output do you need 3 soundcards?

The digital I/O only works with the DGT modes selected. I do not know
what the TX passband is limited to. In USB mode it appears to be about
2.7kHz. I think you only need 2 sound cards in this application.

> Do you have a sample of a config that works?

Yes and no. I have tried to get wsjtx and quisk to work together with
pulse audio using two sinks. Here's some of my startup script (note the
split lines at \) ...

```
...
# set up pulseaudio null sinks
WSJTX_RX_SINK_ID=$(pactl load-module module-null-sink\
sink_name="wsjtx_rx_sink"
sink_properties=device.description="WSJTX_RX_Sink")

WSJTX_TX_SINK_ID=$(pactl load-module module-null-sink\
sink_name="wsjtx_tx_sink"
sink_properties=device.description="WSJTX_TX_Sink")
...
# clean up pulseaudio
echo
echo "**********cleaning up pulseaudio..."
pactl unload-module ${WSJTX_RX_SINK_ID}
sleep 1
pactl unload-module ${WSJTX_TX_SINK_ID}
echo
```

...

Then in quisk_settings.json...

"lin_digital_output_name": "pulse:wsjtx_rx_sink",
"lin_name_of_sound_capt": "hw:0",
"lin_digital_input_name": "pulse:wsjtx_tx_sink.monitor",
"lin_name_of_mic_play": "hw:0",
"lin_name_of_sound_play": "hw:1",
"lin_microphone_name": "hw:1",

hw:0 is a PCI sound card and hw:1 is the motherboard sound chipset.

I am only using pulseaudio to link wsjtx and quisk. Other settings use
alsa to the raw hardware devices.

Then in ~/.config/WSJT-X.ini...

...
SoundInName=wsjtx_rx_sink.monitor
SoundOutName=wsjtx_tx_sink
...

This works on RX, but on TX I got lots of glitches on the TX signal. It
is very important to check your TX signal into a dummy load before
connecting the antenna ;)

It's a work in progress.

Keith,

Quisk has a built in xmlrpc sever, and i just had to point wsjtx to that port. Somewhere in the settings or docs should be the port number. Can't look now, but i can take a look in a few hours if you haven't found it.

nick,

Thanks. Now I get what we need for a loopback. Followed your model for digital in and out. Makes good sense. No problem creating a 2d pa sink wsjtx and wstx_tx.

Good RX in wsjtx, but still no output from quisk.

keith

Eric,

The xmlrpc port appears to be set in the settings json file. But in my version of wsjtx I don't see how to point it at xmlrpc. Quisk seems to crash if I try to use the hardware_net.py configuration.

The "Display fraction" is ignored for the Bandscope so the whole spectrum is visible. I added bandscope support for the Odyssey-2 radio. I changed the HermesLite2 logic to agree with the new firmware. Thanks Steve! I added logic for the SoftRock to correct for rate differences between two sound cards. Thanks to Nick, G3VNC!

From: dajetzi@...
Topic: 2449 Message: 2449

Hello,
i wonder if there is anyone who build there own Arduino MIDI Controller
to operate PowerSDR or Zeus SDR?
I have made some attempts, but i am struggeling a little.
Either my Arduino sketches are working with PowerSDR or Zeus,
but i can not make one sketch to work with both programs.
This is my very first Arduino project, and i have no programing skills so far.

This controller is meant to be installed in a standalone SDR, so no commercial
solution like Behringer CMD PL-1 is an option.

2451. Help with custom hardware interface

Yahoo group: n2adr-sdr
Date: 2017-09-21 15:06:32 UTC
From: murphyst@...
Topic: 2451 Message: 2451

Good Morning,

I'm working on interfacing Quisk to my homebrew transceiver which uses an Arduino controlled Si5351 to provide the tunable LO as well as a fixed LO to drive the SDR "back end". Envision a fixed frequency softrock with a tunable, multi-band front end and you'll get the basic idea.

Long story short - I've got the arduino emulating a Yaesu transceiver and talking to Quisk using hamlib. What I'd like to do is tweak my Quisk configuration so that it displays the tuning frequency without altering Quisk's VFO frequency. I've read N2ADR's notes about doing something similar with an 8600, so I understand the concepts but am hitting a wall when it comes to modifying the Python code.

If anyone can offer any suggestions or point me to some additional examples, I'd really love to hear from you. I'm not a programmer, so please be gentle. I'm also aware that I could embed control of the Si5351 into the Pi running Quisk, but I've already got the Arduino handling all the switching and tuning functions and would rather not reinvent the wheel...

Thanks, 73 and GL,

Steve N8NM

2452. Quisk and FreeDV

Yahoo group: n2adr-sdr
Date: 2017-10-24 08:21:49 UTC
From: dh5ym@...
Topic: 2452 Message: 2452

Hi,

yesterday i tried to update the FreeDV library of my Quisk installation. Basically that one worked after changing the quisk_default_conf.py.
Now i can also access the 700C mode and in Loopback mode of my TRX it can be demodulated. 1600 and 700A work as well. For 2400A and B it seems an FM Modulator / Demodulator would be required. Currently the FDV mode always uses SSB if i am correct. The spectrum also looks slightly lousy. I have to investigate further. Would there be a way to make the FDV modes 2400A and B using FM modulators / demodulators ?
For the 800X mode i think the freedv API denies access and this causes an unhandled exception of Quisk.. Thats not a problem. Just do not wonder ;)

Did anyone of you do FreeDV QSO already ? I saw that also the McHF project has at least mode 1600 implemented.

regards
Mario

2453. Re: Quisk and FreeDV

Yahoo group: n2adr-sdr
Date: 2017-10-24 09:15:45 UTC
From: gvjury@...
Topic: 2452 Message: 2453

Hello Mario,

I have been using Quisk in FreeDV mode to QSO with a friend in VK. I do have the codec downloaded from David's svn but am using the codec supplied with Quisk by Jim. It works although for me the TX level is down quite a bit on the other digital modes and I have run tests with VK3RV who informs me that my audio level is just right when I turn it down to about -25 DB. I run SSB at around -3 to -5 dB so it is quite a difference. The mode is very successful and I use 1.6 KHz bandwidth. It needs a stronger signal than SSB or I get dropouts but for an S5 or more signal on 20 M it is great with some distortion on the speech but nothing which affects the intelligibility. When I FDX to monitor my own signal it does not sound too good but probably is better on air. Good to see you experimenting with the codec.

73, Graeme zl2apv

Topic: 2452 Message: 2454

Hi Graeme,

thanks a lot for your reply. I will try to find a qso partner, maybe on VHF first because on SW my antenna is rather lousy. In FDX mode the 700C sounds rather promising. Lets see how it is in practical use. Required SNR should be a lot lower than for 1600.
Thanks for the comments about the audio volume fed into the codec.
Modification of the codec is not difficult. You just need to put the new library in the freedvpkg directory and delete the old libraries there. In the quisk_conf_default you search for the line with the modes listed and add the new modes.

Mario

2455. Installing Quisk on Raspberry PI2!

Yahoo group: n2adr-sdr
Date: 2017-11-13 10:31:35 UTC
From: sebi_carjan@...
Topic: 2455 Message: 2455

Hello, I've seen this nice SDR on internet and I've decided to install it on my Raspebery PI2. I_Q signals that I intend to use are from a board that I built few years ago using a polyphase network.
After I've got upgrade and update for my Rasp I tried to install the 4.1.10 of Quisk and the process failed when I did "make". The same problem with ver. 4.1.9. on my Rasp.
The process is described here:

```
pi@raspberrypi:~/quisk $ make -j4
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c quisk.c -o
build/temp.linux-armv7l-2.7/quisk.o
quisk.c: In function ‘quisk_process_samples’:
quisk.c:2059:5: warning: this ‘else’ clause does not guard... [-Wmisleading-indentation]
else
^~~~
quisk.c:2061:2: note: ...this statement, but the latter is misleadingly indented as if it
is guarded by the ‘else’
if (tune != 0) {
^~
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c sound.c -o
build/temp.linux-armv7l-2.7/sound.o

2458. Re: Installing Quisk on Raspberry PI2!

Yahoo group: n2adr-sdr
Date: 2017-11-13 17:25:27 UTC
From: sebi.carjan@...
Topic: 2455 Message: 2458

Thank you! You were right! I've installed, "libportaudio2"and "portaudio19-dev", which lacked.
After the process has gone up to final, and lanch from line comand, I've seen quisk large skin, but many errors in configuration. I've tried to change window smaller but I don't succeded. They appeared in gray collour (unchangegible). When I did a reset from this meniu I couldn't lunch the program again.

I've tried to "make" and to invoke python for instal again, but nothing has gone right.

The whole process is bellow:

```
pi@raspberrypi:~ $ cd /home/pi/quisk-4.1.10

pi@raspberrypi:~/quisk-4.1.10 $ make -j4
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c quisk.c -o
build/temp.linux-armv7l-2.7/quisk.o
quisk.c: In function ‘quisk_process_samples’:
quisk.c:2059:5: warning: this ‘else’ clause does not guard... [-Wmisleading-indentation]
else
^~~~
quisk.c:2061:2: note: ...this statement, but the latter is misleadingly indented as if it
is guarded by the ‘else’
if (tune != 0) {
^~
(this warning persists)
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes

Hello to everyone!
I am not a Unix user, and please excuse me with so many details! I saw Quisk working on Youtube to N6QW and it seemed to me wonderful. So, I'd like to see Quisk running on my PI2 - 7" display. Next I'll buy a PI3 which seems run faster.
But seeng how the things go, I'm a bit reticent because of my poor Raspbian (Debian...) knowledge. It is a new world!

Thank you supporting me,

Sebi (YO2CBQ)

```
Check you have libusb packages.
--------------------------------
libusb-0.1-4
libusb-1.0-0
libusb-1.0-0-dev
libusb-dev

Warnings are not unusual but errors in the build are fatal.
"make -j 4"? seems to end normally at quisk-4.1.10/sdriqpkg/sdriq.so
without an error.
"python setup.py install" should also not show up an error.
Launch from within quisk-4.1.10 with "python quisk.py" as sometimes
there can be a rogue previous install with a binary at /use/bin/quisk.

If there is a file ~/quisk_conf.py", remove it. ~/quisk_settings.json is
generated at startup.
Depending on the screen size you may manually have to change the setting
"Large screen" to
"button_layout": "Small screen" if you have e.g a 7 inch LCD screen.

I have had to play with other values for a 7 inch screen
????? "default_font_size": "12",
????? "favorites_font_size": "10",
????? "config_font_size": "14",
????? "button_font_size": "14",
????? "graph_font_size": "12",
????? "fft_size_multiplier": "0",
????? "graph_msg_font_size": "14",
????? "status_font_size": "8",
????? "window_height": "600",

If it's a touch screen install xinput-calibrator package and run
xinput_calibrator --list to see the list of input device ID's
xinput_calibrator --device <id>
Use the mouse to click on + in the upper left corner, it then jumps to
the upper right corner, next click it jumps to the lower left corner,
next to the lower right corner, next it prints out the settings and
information where to store it. e.g:
# cat /usr/share/X11/xorg.conf.d/99-calibration.conf
Section "InputClass"
??????? Identifier????? "calibration"
??????? MatchProduct??? "eGalax Inc. Touch"
??????? Option? "Calibration"?? "2058 10 38 2050"
??????? Option? "SwapAxes"????? "0"
####??????? Option? "InvertX"?? "1"
EndSection
```

Sometimes the sense is wrong, e.g scroll up works as scroll down, scroll
left scrolls right, change Option "SwapAxes" "1"
If only X or Y are inverted? Option "InvertX" "1" or Option "invertY" "1"
Then reboot.

73 ... Sid.

Looks like I have just answered some of the questions in my post just sent.

The Pi 3 is certainly faster.

I started with a Pi 1 model B then a Pi 2, Pi 3, ODROID-X/-U3/-C1 and
now a -C2. I am now preparing to use a NanoPi M3 (8-core 64-bit) which
is amazingly fast.
The M3 has been superceded by the NanoPi Fire3 which is a smaller board
- it's really a M3 with only 1 USB2.0 port and no WiFi.

My QRZ.com page to see my HiQSDR transceiver with a built in 7 inch
touch screen. It started out using a Pi 1 model B, upgraded to a Pi 3
and now runs an ODROID-C2.
73 ... Sid.

Sebi, I think that's the right approach, I haven't tried it on the R-Pi1 but the Pi-3 and touchscreen runs Quisk very nicely. While receiving SSB the load average is about .75, meaning it's using 3/4 of one CPU core, which leave plenty of processing power available to do other things (and suggests that it will run just fine on the Pi-2 as well).

It was definitely a learning experience getting the configuration settings right, but the most challenges were with the Pi audio where Alsa audio through the internal audio jack is the most reliable. Bluetooth audio does work but I've had problems with it hanging up after starting/stopping the SDR and unable to recover without a hassle. I've also used one of the cheap USB soundcards driving an amplified speaker.

I've configured Quisk to work with both my Hermes-Lite 1.0 via ethernet, and RS-HFIQ (USB soundcard). My initial experiences using wi-fi was really poor, and after reading about some issues with the Pi I decided to switch to hardwired ethernet. These issues may be corrected by now, I need to upgrade by software and give it another try. I also need to fight thru re-installing the DV software, which was a real pain.

One trick you might want to try for initial setup is to install an X Server (I use Xming) on your PC so you can run Quisk remotely and display the "large" screen. Once you change it to the "small" screen and get your configuration right, you can close the remote connection and try running from the Pi directly. Everything fits nicely on the small screen except you do have to scroll to the right in the radio configuration screens. The buttons on the Pi touchscreen as small, but I've been able to use them just fine, even though a wired or bluetooth pointing device is generally easier for tuning.

Here's a pic of the Pi touchscreen to provide encouragement that it can be done!

https://i.imgur.com/kGgq4Lt.jpg

I'm certainly no Linux guru, so with persistence I'm sure you will have equal success. Thanks again to N2ADR for such a fine piece of software!

Hi Sebi.
I have just tried installing quisk-4.1.10 on a pi2 it took ten minutes from pressing "Make" for the Quisk display screen to appear,(very very slow)
this was with pi2 set to tubo mode, it then locked the screen. As Syd said pi3 is a lot faster and I don't think you will be dissapointed. It will also run pihpsdr software. (I use pi3 and pine64 with Quisk software).

Dave.g0vvf.

You just jogged my memory, the picture of the standalone HiQSDR on my QRZ.com page shows a Pi 1 model B running rasdr.
I need to take some current pictures.

The Pi 3 limited the HiQDSDR to 192K samplerate, running 384K with the ODROID-C2.
The one problem with going higher e.g 960K samplerate is that the small screen display gets way too crowded to be of any real use.

I used the PINE A64+ at one stage, ran fine also.

N2ADR-SDR / HiQSDR TransceiverThank you my friends,

Your advices are welcomed! Sid, I am interested in your development with NanoPi M3. I've seen your achievements, impressive!
Robert, I saw your Quisk JPG! Looks fine! Anyhow you skill better like me with Unix and networks. For example, I didn't success to view my PI2 from my computer. I admit, I wasn't too insistent.

Last night I reinstalled from zero my PI2 and installed the requested libs! I installed again Quisk and set the smaller window. Everything went well!
After I configured "My Radio" and sound (as I've guessed) the radio begun to run on Graph and I've got sound at the PI2 output. My problem is that I use Xonar U7 and I noticed that it has only one Audio input (line or microphone) and many outputs, the best being stereo (default). I like this SoundBlaster because of 114dB SNR. Just on the Quisk I see S-meter S0 –108dB, without any input signal from RF-hardware. But what I'll do with microphone? Should I put another sound card?
After my knowledge, should be on sound card:
-1 input for I/Q coming from RF-hardware;
-1 output for I/Q going to RF-hardware;
-1 input for microphone.
Audio (output of radio) is from PI2, BCM2835.

In this stage I have some doubts. I see in config Sound as Playback, Xonar U7 USB Audio (hw:1,0), Xonar U7 USB Audio #1 (hw:1,1), Xonar U7 USB Audio #1 (hw:1,2)! What means #1, and #2 and arguments from brackets.

On the other hand, I have buttons in white (inscriptions) among them, PTT, VOX, Add Rx. I don't know, why?
Since I have no ready boards with RF-hardware, may I test Quisk otherwise?

Best,
Sebi

1a Installing Quisk on Raspberry PI2! Mon Nov 13, 2017 2:31 am (PST) . Posted by:

sebi_carjan Hello, I've seen this nice SDR on internet and I've decided to install it on my Raspebery PI2. I_Q signals that I intend to use are from a board that I built few years ago using a polyphase network.
After I've got upgrade and update for my Rasp I tried to install the 4.1.10 of Quisk and the process failed when I did "make". The same problem with ver. 4.1.9. on my Rasp.
The process is described here:

```
pi@raspberrypi:~/quisk $ make -j4
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c quisk.c -o
build/temp.linux-armv7l-2.7/quisk.o
quisk.c: In function ‘quisk_process_samples’:
quisk.c:2059:5: warning: this ‘else’ clause does not guard... [-Wmisleading-indentation]
else
^~~~
quisk.c:2061:2: note: ...this statement, but the latter is misleadingly indented as if it
is guarded by the ‘else’
if (tune != 0) {
^~
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c sound.c -o
build/temp.linux-armv7l-2.7/sound.o

If I remember right there are test scripts in the main folder to test if
you have functioning alsa, pulseaudio and other audio streams

Thank you! You were right! I've installed, "libportaudio2"and "portaudio19-dev", which lacked.
After the process has gone up to final, and lanch from line comand, I've seen quisk large skin, but many errors in configuration. I've tried to change window smaller but I don't succeded. They appeared in gray collour (unchangegible). When I did a reset from this meniu I couldn't lunch the program again.

I've tried to "make" and to invoke python for instal again, but nothing has gone right.

The whole process is bellow:

pi@raspberrypi:~ $ cd /home/pi/quisk-4.1.10

pi@raspberrypi:~/quisk-4.1.10 $ make -j4
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g
-fdebug-prefix-map=/build/python2.7-9xgeTe/python2.7-2.7.13=. -fstack-protector-strong
-Wformat -Werror=format-security -fPIC -I/usr/include/python2.7 -c quisk.c -o
build/temp.linux-armv7l-2.7/quisk.o
quisk.c: In function ‘quisk_process_samples’:
quisk.c:2059:5: warning: this ‘else’ clause does not guard... [-Wmisleading-indentation]
else
^~~~
quisk.c:2061:2: note: ...this statement, but the latter is misleadingly indented as if it
is guarded by the ‘else’
if (tune != 0) {
^~
(this warning persists)
arm-linux-gnueabihf-gcc -pthread -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes

```
-fno-strict-aliasing -Wdate-time -D_FORTIFY_SOURCE=2 -g

Hello to everyone!
I am not a Unix user, and please excuse me with so many details! I saw Quisk working on Youtube to N6QW and it seemed to me wonderful. So, I'd like to see Quisk running on my PI2 - 7" display. Next I'll buy a PI3 which seems run faster.
But seeng how the things go, I'm a bit reticent because of my poor Raspbian (Debian...) knowledge. It is a new world!

Thank you supporting me,

Sebi (YO2CBQ)

Reply to sender . Reply to group . Reply via Web Post . All Messages (8) . Top ^ 1f Re: Installing Quisk on Raspberry PI2! Mon Nov 13, 2017 10:15 am (PST) . Posted by: "Sid Boyce" priddix Check you have libusb packages.

```
--------------------------------
libusb-0.1-4
libusb-1.0-0
libusb-1.0-0-dev
libusb-dev
```

Warnings are not unusual but errors in the build are fatal.
"make -j 4"? seems to end normally at quisk-4.1.10/sdriqpkg/sdriq.so
without an error.
"python setup.py install" should also not show up an error.
Launch from within quisk-4.1.10 with "python quisk.py" as sometimes

there can be a rogue previous install with a binary at /use/bin/quisk.

If there is a file ~/quisk_conf.py", remove it. ~/quisk_settings.json is
generated at startup.
Depending on the screen size you may manually have to change the setting
"Large screen" to
"button_layout": "Small screen" if you have e.g a 7 inch LCD screen.

I have had to play with other values for a 7 inch screen
????? "default_font_size": "12",
????? "favorites_font_size": "10",
????? "config_font_size": "14",
????? "button_font_size": "14",
????? "graph_font_size": "12",
????? "fft_size_multiplier": "0",
????? "graph_msg_font_size": "14",
????? "status_font_size": "8",
????? "window_height": "600",

If it's a touch screen install xinput-calibrator package and run
xinput_calibrator --list to see the list of input device ID's
xinput_calibrator --device <id>
Use the mouse to click on + in the upper left corner, it then jumps to
the upper right corner, next click it jumps to the lower left corner,
next to the lower right corner, next it prints out the settings and
information where to store it. e.g:
cat /usr/share/X11/xorg.conf.d/99-calibration.conf
Section "InputClass"
??????? Identifier????? "calibration"
??????? MatchProduct??? "eGalax Inc. Touch"
??????? Option? "Calibration"?? "2058 10 38 2050"
??????? Option? "SwapAxes"????? "0"
####??????? Option? "InvertX"?? "1"
EndSection

Sometimes the sense is wrong, e.g scroll up works as scroll down, scroll
left scrolls right, change Option "SwapAxes" "1"
If only X or Y are inverted? Option "InvertX" "1" or Option "invertY" "1"
Then reboot.

73 ... Sid.

The Pi 3 is certainly faster.

I started with a Pi 1 model B then a Pi 2, Pi 3, ODROID-X/-U3/-C1 and
now a -C2. I am now preparing to use a NanoPi M3 (8-core 64-bit) which
is amazingly fast.
The M3 has been superceded by the NanoPi Fire3 which is a smaller board
- it's really a M3 with only 1 USB2.0 port and no WiFi.

My QRZ.com page to see my HiQSDR transceiver with a built in 7 inch
touch screen. It started out using a Pi 1 model B, upgraded to a Pi 3
and now runs an ODROID-C2.

Sebi, I think that's the right approach, I haven't tried it on the R-Pi1
but the Pi-3 and touchscreen runs Quisk very nicely. While receiving SSB
the load average is about .75, meaning it's using 3/4 of one CPU core,

which leave plenty of processing power available to do other things (and suggests that it will run just fine on the Pi-2 as well).

It was definitely a learning experience getting the configuration settings right, but the most challenges were with the Pi audio where Alsa audio through the internal audio jack is the most reliable. Bluetooth audio does work but I've had problems with it hanging up after starting/stopping the SDR and unable to recover without a hassle. I've also used one of the cheap USB soundcards driving an amplified speaker.

I've configured Quisk to work with both my Hermes-Lite 1.0 via ethernet, and RS-HFIQ (USB soundcard). My initial experiences using wi-fi was really poor, and after reading about some issues with the Pi I decided to switch to hardwired ethernet. These issues may be corrected by now, I need to upgrade by software and give it another try. I also need to fight thru re-installing the DV software, which was a real pain.

One trick you might want to try for initial setup is to install an X Server (I use Xming) on your PC so you can run Quisk remotely and display the "large" screen. Once you change it to the "small" screen and get your configuration right, you can close the remote connection and try running from the Pi directly. Everything fits nicely on the small screen except you do have to scroll to the right in the radio configuration screens. The buttons on the Pi touchscreen as small, but I've been able to use them just fine, even though a wired or bluetooth pointing device is generally easier for tuning.

Here's a pic of the Pi touchscreen to provide encouragement that it can be done!

https://i.imgur.com/kGgq4Lt.jpg

I'm certainly no Linux guru, so with persistence I'm sure you will have equal success. Thanks again to N2ADR for such a fine piece of software!

73, Bob W9RAN

Topic: 2465 Message: 2466

You definitely need RF hardware for quisk to communicate with.
The radios - softrock, charleston, Hermes-Lite (hermeslite.com), HiQSDR,
Jim's own N2ADR transceiver, Peaberry/Omnia-SDR and sdr-iq.

Jim recently said he was working on support for ODYYSEY 2.

I have yet to get around to testing some openHPSDR Hermes+eb104.ru BPF
and 300W PA/LPF filter settings Jim supplied quite a while ago.
It would be great to be able to use quisk with Hermes.

It would be interesting to see the output of terminal commands to see
exactly what the Xonar U7 provides.
cat /proc/asound/cards
fsuever -v /dev/snd/*
73 ... Sid.

NanoPi M3 or Fire3
==========
https://github.com/rafaello7/debian-installer-nanopi-m3/releases and
download ubuntu-installer-nanopi.img
https://github.com/rafaello7/debian-installer-nanopi-m3 follow section

How to install Debian or Ubuntu using the installer

On booting the microSD card it asks where to install /boot and /, simple
if using only the microSD card.
Mine was more convoluted - /boot must be on the SD card but I wanted to
install / on a USB hard drive, a few trials and errors before I achieved it.
73 ... Sid.

Attachments: 5 described; binary payloads are missing from this source WARC

Good morning,
I hate this digest way! Just I lost a post yesterday!

I reinstalled from zero Raspbian, libs and Quisk. It seems all is going well. I can listen audio output from PI2. However, I have some questions.
- How to get microphone input since I have only one audio input (Line-in, or microphone) on Xonar U7? PI2, has only playback output. But system being simplex would be a possibility to change Line in in microphone when TX. I don't know if it just runs!
Input audio from Pulse audio/Volum control, that I notice has only a possibility: setting only one,

-I can't see Tx output, because there isn't ability to do it (inhibited PTT).
Sid, look at results you asked me:

```
pi@rasp_sebi:~ $ cat /proc/asound/cards
0 [ALSA ]: bcm2835 - bcm2835 ALSA
bcm2835 ALSA
1 [U7 ]: USB-Audio - Xonar U7
ASUS Xonar U7 at usb-3f980000.usb-1.3, high speed
```

```
pi@rasp_sebi:~ $ fsuever -v /dev/snd/* // this command doesn't work!
bash: fsuever: command not found
```

Few attachments of my Quisk!

Sebi

Apologies, I didn't spot the typo, it should be "fuser -v /dev/snd/*"
73 ... Sid.

Tnx Sid,

Look what I've got:

```
pi@rasp_sebi:~ $ cat /proc/asound/cards

pi@rasp_sebi:~ $
```

I've understood I need RF-Hardware. I built a RTX Poliphase two years ago and I took I/Q out for an eventual SDR receiver. Unfortunatelly I dismounted it to change DDS firmware(I've not finished)and need a while to make it runnig.
This U7 is a good audio-card. Just I used it to test few tube amplifier using Arta Software with good results.

However I tested Rx, injecting I/Q signals to the Xonar U7 Line-In inputs, on Graph (Scope) signal show nice. My problem is that can't see Tx output, because there isn't ability to do it (inhibited PTT).
I uploaded few quisk photos, but I cant see them on my post!
Looking at NanoPI, seems to me is a top product. It will be a next project and I hope to inspire me from you. Firstly I'd like to finish PI2 application.

```
Depends on what radio you intend to connect, DDC/DUC rigs such as HiQSDR
and Hermes-Lite only require one sound card for Mic/Spkrs,
Softrock needs 2 sound cards, one for Mic/Spkrs and one to interface
with the rig, Peaberry/Omnia have on-board codec chip only requiring one
sound card for Mic/Spkrs.

Without a rig connected and configured quisk really does nothing.
root@odroid64:~# cat /proc/asound/cards
?0 [ODROIDHDMI???? ]: ODROID-HDMI - ODROID-HDMI
?????????????????????? ODROID-HDMI
?1 [Device???????? ]: USB-Audio - USB Sound Device
?????????????????????? USB Sound Device at usb-dwc2_b-1.4, full speed

Hermes-Lite is connected to this ODROID-C2, doesn't matter whether it
would be a PC, Raspberrr Pi or any other ARM platform. python in the
display indicates? that quisk is using card 1 for Mic/Spkrs.
root@odroid64:~# fuser -v /dev/snd/*
?????????????????????? USER??????? PID ACCESS COMMAND
/dev/snd/controlC0:? odroid???? 1143 F.... pulseaudio

Sid,
Structure of this Trx runs in the same way like SftRock built after my mind. Instead of a DSP it has a polyphase network, an analogical manner to get SSB. It looks like with the project of OH2NLT, using only one RC network. You can see here OH2NLT TRX http://www.jumaradio.com/juma-trx2/ http://www.jumaradio.com/juma-trx2/ .

If I look to Quisk and my trx I notice that I need:
1. I/Q in-out
I/Q output for Tx. I have it on U7 (audio output)
I/Q input, for signals that comes from Rx module of trx. I have it on U7 (line-in)
2. In/Out to the user
Sound Output (from PI board) for speaker.
Sound input for microphone needed by Quisk. I don't have it!

Tell me where am I wrong?

Sebi

The Softrock is controlled by quisk over USB talking to the DG8SAQ firmware.
The Juma appears to have only a serial interface.

May be it would have to be keyed via RS232 interface which should then
enable the PTT button, e.g for sdr-iq

quisk_conf_defaults.py:## sdriq_name   Serial port, text
quisk_conf_defaults.py:# The name of the SDR-IQ serial port to open.
quisk_conf_defaults.py:# transmit somehow, for example, by setting a
serial port pin to high.
quisk_conf_defaults.py:# key_method = "/dev/ttyS0"   # Use the named
serial port

Hi Sid,
We speak about analog inputs/outputs! SDR has two quadrature mixers (usually Tayloe), one for Rx another one for Tx. Both use I/Q signals, Rx source I/Q, Tx sink I/Q. These signals are analog and they are converted digitally in sound cards. All these analog inputs/outputs from SDR use ability of stereo channels from sound cards (I -> channel 0, Q -> channel 1, or inverted, to keep USB and LSB correct).
Like any transceiver we need analog input/output for microphone and speaker. This kind of SDR trx use Serial, I2C, USB, etc. for comands like bands, frequency (DDS comands or SI570), modes (SSB, CW), PTT...This structure is similar to SoftRock.

Hermes, and many others, do SDR in FPGA and have ADC and DAC on the same board, so that they work directly digital using USB for data streaming. They need only analog input/output only for microphone and speaker (we live in analog world). There is SDR which has the same structure like SoftRock but I/Q analog signals are converted digital on the same board and data streaming through USB comes in computers. They don't need any sound card for analogI/Q .

Looking at my needs, physically I need an analog input for microphone (where may I connect it?). I'll buy another sound card for that. I don't like PI2, because it has only analog output (which I use for speaker) and no any analog input for microphone. On the other hand U7 has many analog stereo outputs but only a switchable analog input for microphone or Lin-in. Hope you have understood my problems!
.
Myself I'm a newbie in Unix, so that I can't understand well enough so many commands! Now, I can't set Quisk to run in Tx. I have all Tx buttons inhibited. If I do setting matched for (inputs/outputs of sound cards) for Tx I don't see enabling the buttons for Tx and no any analog signals to the sound card output!

Rx runs fine! I saw signals on the Quisk Graph when I put I/Q signals from a generator to the analog inputs of sound card (U7).

2483. Quisk not working with Hermes

Yahoo group: n2adr-sdr
Date: 2017-11-17 19:46:59 UTC
From: bjarnevs@...
Topic: 2483 Message: 2483

I am using a Raspberyy PI2 B+, and I just installed the newest version of Quisk on my RPI2. When I am trying to start the program with the Hermes as startup radio, I'm getting this error: "Failure for hardware file hermes/quisk_hardware.py!".
And then the terminal says this after I press "OK":

```
ALSA lib pcm.c:2495:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.front
ALSA lib pcm.c:2495:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.rear
ALSA lib pcm.c:2495:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.center_lfe

conf.tx_ip = Hardware.hermes_ip
AttributeError: Hardware instance has no attribute 'hermes_ip'
```

I am quite new to Linux, so I don't know what the problem is...

I've tried reinstalling Quisk several times, each times using a different guide, and I still end up with the same error.

Does anyone have a solution for this particular problem?

I would greatly appreciate your help!

Bjarne,
OZ1UM

2484. Re: [n2adr-sdr] Quisk not working with Hermes

Yahoo group: n2adr-sdr
Date: 2017-11-18 01:24:35 UTC
From: Sid Boyce
Topic: 2483 Message: 2484

You can ignore the ALSA messages, they are just noise.
root@odroidC2:/opt/quisk-4.1.10# grep hermes quisk.py
??????? conf.tx_ip = Hardware.hermes_ip
????????? d = QS.get_hermes_adc()
The above code is working for Hermes-Lite but I don't know if it should
also work for Hermes.

Almost a year ago - how time flies - I ran quisk on Hermes+eb104.ru
BPF/300W PA/LPF, it worked except for the filter switching via J16.
Jim sent me some settings to try. I hope to do so perhaps on Monday.

I was busy with other stuff and ran out of bench space but now it's
almost ready.
I changed the resistor on Hermes as required for Protocol2 support.
I'll check quisk-4.1.10 before I program the Protocol2 firmware.
73 ... Sid.

Hi Sid

Thank you for your answer.

Since I am not good with Linux, I'm afraid I don't know what I have to do with the code you just sent me.

I tried to find the quisk-4.1.10 folder you were specifying under /opt/, but it wasn't there.

It's my two sons whom are trying to get the RPI2 working with Hermes because I'm not good at all with computers and software in general.

I hope you have a solution.

Hi Bjarne,
That's part of the C code in quisk which may or may not be significant if I have the same? problem as you have and I need to ask Jim for help. The ADC in Hermes-Lite and Hermes are not the same so a change may be necessary.

I chose to store the source for quisk-4.1.10 in /opt. It can be stored anywhere so i's of no real significance. It could be installed in /home/pi or anywhere else.

Hi Sid

Thank you again for your answer.

I'm very happy that you want to help me.

I found the folder where Quisk is located and I still don't know what to do exactly (pardon my bad Linux skills...)

I would really love to get Quisk running properly on my RPI2. I already have it running on a Windows-based system.

No problem, everyone has to start somewhere.
Over the weekend I shall see if I can put together something that will help you. The main difficulty is installing the pre-req packages so Ill try to get you some instructions using the GUI although I don't use it to install them and the documentation hasn't been updated in quite a long time to reflect the name of the latest packages.

Thank you for the info.

We will take it slowly so no hurry.

I have in this moment quisk running on HIQSDR, ANAN 10, and Red Pitaya, but it would be interesting to try the little RPI2 B+ just of curioucity.

For your information I love the Quisk program, it fits me very well. The only thing I need on this program is a new FDV mode 700C.

We often use mode 1600 here by the experimenters (not many of them anymore)

I agree Bjarne, and I think the integrated support for DV is a real plus for Quisk. However I struggled for several hours to install it the first time and after reinstalling a newer version of Quisk of course it's no longer available, so I need to do that process again (and of course I've forgotten what I finally ended up doing the first time!).

If anyone has tips or an improved procedure I'd be appreciative of it, since this is a good way to make use of these new digital voice modes.

Hi,

you need to copy a new library libcodec2.so into freedvpkg subdirectory (you may delete the old) and add entries for the new modes to the quisk_conf_defaults.py after building from source.

freedv_modes = (('Mode 1600', 0), ('Mode 700', 1), ('Mode 700B', 2), ('2400A', 3), ('2400B', 4), ('800XA', 5), ('700C', 6))

2400 Modes will not work because using the wrong modulator, 800XA is not enabled in the library and will assert and cause Quisk to crash.

regards
Mario

Hello Mario,

I used .quisk_conf.py to save my settings as below. I originally got these settings from a post from you and they work just fine thank you. Yes the 2400 modes are not working yet and the 800X mode crashes Quisk so I don't try to use them for now.

I notice that the power out on FreeDV is down on other digital modes and wonder if this is normal or if I have a wrong setting. It is a long way down probably around 6 dB or so which I would like to raise if possible.

My .quisk_conf.py file contents:

```
# This is a sample config file for the N2ADR 2010 transceiver hardware and for the
# improved version HiQSDR. If you use the HiQSDR you should upgrade your firmware
# to version 1.1.

#from hiqsdr import quisk_hardware

# These are the initial values for the Y-scale and Y-zero sliders for each screen.
# The sliders go from zero to 160.
graph_y_scale = 75 # Ys Slider
graph_y_zero = 81 # Yz Slider

## freedv_tx_msg FreeDv Tx message, text
# For freedv, this is the text message to send.
#freedv_tx_msg = ''
freedv_tx_msg = 'ZL2APV Graeme, New Plymouth, RF70bw \n'

# This is the list of FreeDV modes and their index number. The starting mode is the first
listed.
freedv_modes = (('Mode 1600', 0), ('Mode 700', 1), ('Mode 700B', 2), ('2400A', 3),
('2400B', 4), ('800XA', 5), ('700C', 6))
```

When I tried listening freedv the bands were dead most of the time and
still are.

Most likely your loss of FDV could be due to the 32-bit x86 version of
the library Jim includes in the package.

What I do here is replace his version on all platforms - Arm, Arm64 and
x86_64 with the ones installed on the system, e.g:-
"cp -dp /usr/local/lib/libcodec2.so* /opt/quisk-4.1.10/freedvpkg/"
Run "make" and "python setup.py install"
root@odroidC2:/opt/quisk-4.1.10# ls -l freedvpkg/
total 1076
lrwxrwxrwx 1 root root????? 16 Oct 20 21:18 libcodec2.so -> libcodec2.so.0.8
-rw-r--r-- 1 root root 1091992 Nov 20 02:28 libcodec2.so.0.8
-rwxrwxrwx 1 root root??? 4247 Aug? 6? 2015 README.txt
root@odroidC2:/opt/quisk-4.1.10# ls -l freedvpkg/
total 1076
lrwxrwxrwx 1 root root????? 16 Oct 20 21:18 libcodec2.so -> libcodec2.so.0.8
-rw-r--r-- 1 root root 1091992 Nov 20 02:28 libcodec2.so.0.8
-rwxrwxrwx 1 root root??? 4247 Aug? 6? 2015 README.txt

FDV-U shows up in quisk

I use codec2-dev built from source, the previous libcodec2.so.6 and the
latest libcodec2.so.8 are fine.

I am using? 7 inch touch screens on 3 ODROID-C2's, one for Hermes-Lite, one in my standalone HiQSDR and one on the LAN that also works with Hermes-Lite and reserved for the Hermes based rig.

I removed? ~/quisk_conf.py from my systems when the change was made to? ~/quisk_settings.json, without ~/quisk_conf.py I used the quisk CONFIG button to configure everything from scratch which saves it to the json file.
The only references in ~/quisk_settings .json
root@odroidC2:/opt/quisk-4.1.10# grep -i freedv /home/odroid/quisk_settings.json
????? "freedv_tx_msg": "Sid G3VBV - Halesowen, UK",
????? "add_freedv_button": "1"

I select FDV-U mode, right click on the table icon to the right of FDV-U=> brings up a selection list
Upper sideband
Lower sideband
Mode 1600
Mode 700
Mode 700B
Future 3
Future 4
73 ... Sid.

2495. Quisk Version 4.1.11 November 2017

Yahoo group: n2adr-sdr
Date: 2017-11-20 17:34:43 UTC
From: jahlstr@...
Topic: 2495 Message: 2495

I added a fix for the Proficio USB frequency control from Stew, N8VET and Tony, VK4KRC. Thanks! I changed the Config/Radio/Bands/IO Bus screen to a bit field instead of an integer for the Hermes Lite. There is a new "Frequency round for SSB" on the radio/options screen. It rounds the left mouse click to 1000 Hertz for voice modes on HF. This is useful when most voice stations are at a multiple of 1000 Hertz. It defaults to zero, so enter 1000 (or other rounding frequency) to turn it on. The graph Ys and Yz settings are now saved for each band.

Jim

2497. Wx Phoenix

Yahoo group: n2adr-sdr
Date: 2017-11-27 00:00:40 UTC
From: artus1947@...
Topic: 2497 Message: 2497

In the FWIW column, I upgraded the OS on my bench Windows 10 machine to 64 bits which required a re installation of Python. I installed the latest Python 2.7 and used PIP to install wxPython. PIP installed the 4.0 Phoenix version. I could not get Quisk to work with it. I complained about the wxversion module which is no longer supported in Phoenix. Also it complained about the combo module. Removing Phoenix and installing a legacy 3.0 version fixed the problem.

From: jahlstr@...
Topic: 2498 Message: 2498

Sid, G3VBV, updated the documentation file. Thanks Sid! I fixed a network problem with the HiQSDR on Windows 10.

There is now an easy way to connect Quisk to an external digital program such as Fldigi or wsjtx by using Linux PulseAudio. Just set the names pulse:QuiskDigitalInput and pulse:QuiskDigitalOutput on your radio Sound configuration screen. Quisk will create the necessary loopback devices. Then set your digital program output/input to Quisk input/output. Press the Help button for documentation, and see the docs.html file for details.

Jim

From: Sid Boyce
Topic: 2498 Message: 2499

Thanks Jim,
There are some more documentation changes to be made, mainly updating the pre-req packages as the names have changed with Ubuntu versions. These will apply to Ubuntu 16.04.x LTS.

I shall have a look again tomorrow.

BTW -- How is your ODY-2 performing.
I have ordered one.

The BGA616 on my HiQSDR blew and destroyed the tracks to it. The first one died and this was the replacement which worked for quite a while. I built one on a small piece of circuit board with short leads to the main board but without success so I have to get in there with a scope to see what's what.

I see David has used a different op-amp in the ODY-2 due to BGA616 failures on the ODY-1.

2500. quisk_4.1.12-1_source.changes ACCEPTED into unstable

Yahoo group: n2adr-sdr
Date: 2017-12-05 04:43:44 UTC
From: Maitland Bottoms
Topic: 2498 Message: 2500

Hi,

It has been a couple of years since I've used quisk. Looks
even nicer now!

I went ahead and uploaded Quisk 4.1.12 into Debian.

Folks tracking Debian's unstable branch can install it soon.
Folks tracking the testing branch should be able to
install it this weekend. Bug reports welcome.
(That would be `apt install quisk`, not pypi.)

Hello Bjarne,

It has been a while since I did it so am not 100% sure but I downloaded from the svn and compiled Codec 2 by following the instructions in the INSTALL file and allowed it to install in /usr/local then created a symlink to /usr/bin. This file worked just fine when copied to the Quisk freedvpkg directory. I used the codec2-dev source a i wanted the new modes that David Rowe has developed. I work into VK on 20 metres from time to time and really enjoy the mode.

If you have the subversion package installed you need to "svn checkout"
codec2-dev.? Pre-req packages:- libspeex-dev, libspeex1,
libspeexdsp-dev, libspeexdsp1.
svn checkout https://svn.code.sf.net/p/freetel/code/codec2-dev
A??? codec2-dev/octave
A??? codec2-dev/octave/twod_fbf.m
A??? codec2-dev/octave/vq_construct_indep_mg.m
A??? codec2-dev/octave/kmeans2.m
A??? codec2-dev/octave/sample_clock_offset.m
A??? codec2-dev/octave/newamp1_fbf.m
A??? codec2-dev/octave/vq_construct_mg.m
A??? codec2-dev/octave/plot_specgram.m
etc., etc.
A??? codec2-dev/wav/forig.wav
A??? codec2-dev/wav/hts2a.wav
?U?? codec2-dev
Checked out revision 3386.
root@odroid64:#?? cd codec2-dev/
root@odroid64:codec2-dev#

2507. quisk configuration screens - 1

Yahoo group: n2adr-sdr
Date: 2017-12-30 20:33:06 UTC
From: Sid Boyce
Topic: 2498 Message: 2507
Attachments: 1 described; binary payloads are missing from this source WARC

I thought about including these in the Documentation but decided against it for now.

If you start without the ~/.quisk_conf.py you can use the config button to configure your radios, the results automatically get stored in ~/quisk_settings.json

I did have to edit the file manually to get proper height and width display for Small screen displays.

73 ... Sid.

From: bjarnevs@...
Topic: 2483 Message: 2511

I am still insecure as to what to do.

I am a complete novice so I would love to know if there is a very detailed guide on how to make the codec2 on Windows 10.

If there isn't such a guide anywhere, would you kindly elaborate your own guide in more details? There might be others in this forum that would need help with this too.

Happy new year to everyone in the group!
And special thanks to you Sid for helping me out!

Is there a way that I can change the default value of the Zo control?

Long story short: When I launch Quisk, I always bump the slider up a tick or two. I know, the effort to do that is trivial, but it'd still be nice if I could skip that step...

A big thank you to Jim and all those who contribute to making Quisk available to the amateur community! I'm constantly blown away by how well it works, and it keeps getting better as I learn how to tweak the configuration files. Wow!

I've attached a pic of the SDR-based rig I'm currently building, which runs Quisk on an embedded Raspberry PI/touch screen. The hardware uses one of the old Softrock RXTX 6.2 boards as the IF, ahead of which is a diode-ring mixer and banks of band-pass and low-pass filters to cover all the HF ham bands. The LO is an Si5351 controlled by an Arduino Pro-Mini, which emulates a Yaesu FT817, allowing it to communicate with Quisk using hamlib. It's been a fun project!

2513. Quisk failure with H-L

Yahoo group: n2adr-sdr
Date: 2018-02-10 05:25:24 UTC
From: Robert Nickels
Topic: 2513 Message: 2513

For reasons I haven't been able to figure out, Quisk has stopped working with my Hermes-Lite (ver.1). I know the H-L is OK because I can control it with Power SDR and Spark SDR, and I know that Quisk is basically OK because I can use it to control a different SDR. The same problem occurs locally (on a Raspberry Pi 3) or when I connect via X/ssh. I haven't done any recent updates to anything.

When I run quisk -a, the top error screen shown here is displayed (which I haven't seen before): https://i.imgur.com/TARKHq3.png

When I click OK on it I get the hardware failure message and then it closes with the following error and traceback in the console:

```
pi@raspberrypi:~/Downloads/quisk $ quisk -a
03:59:54: Debug: Failed to connect to session manager: SESSION_MANAGER
environment variable not defined
Traceback (most recent call last):
  File "/usr/local/bin/quisk", line 8, in <module>
    quisk.main()
  File "/usr/local/lib/python2.7/dist-packages/quisk/quisk.py", line
5221, in main
  File "/usr/local/lib/python2.7/dist-packages/quisk/quisk.py", line
3037, in __init__
  File "/usr/lib/python2.7/dist-packages/wx-3.0-gtk2/wx/_core.py", line
8628, in __init__
    self._BootstrapApp()
  File "/usr/lib/python2.7/dist-packages/wx-3.0-gtk2/wx/_core.py", line
8196, in _BootstrapApp
    return _core_.PyApp__BootstrapApp(*args, **kwargs)
  File "/usr/local/lib/python2.7/dist-packages/quisk/quisk.py", line
3456, in OnInit
AttributeError: Hardware instance has no attribute 'hermes_ip'
```

The last line - "hermes_ip" - when running Quisk with the other SDR I've confirmed that My H-L config is set for the same IP that works with Power SDR and Spark, and I can ping the H-L from the Pi so I know they're able to communicate. As mentioned, the behavior and error messages are identical on the Pi locally or when connecting to it remotely. From my reading, SESSION_MANAGER environment variable can mean a lot of different things and I haven't been able to understand what it means in this case.

Any suggestions or pointers would be appreciated!

Thanks and 73,
Bob W9RAN

2514. Quisk Version 4.1.14 March 2018

Yahoo group: n2adr-sdr
Date: 2018-03-12 21:08:12 UTC
From: jahlstr@...
Topic: 2514 Message: 2514

The use of the Spot button for testing has been removed, and proper operation restored. There are further improvements to the Hermes-Lite power and current calculations, including a correction to the PA current measurement from Steve. Thanks Steve!

There is a new "Keys" tab in the configuration screens where you can set one or two hot keys to press the PTT button. Space bar seems a popular choice. I added a toggle option so that PTT stays on until the next key press.

I made further improvements to wxPython 4.x Phoenix support, but feel free to continue to use the 3.x version.

Jim

Hi,

Just joined the group and hoping to get some info on how to get the above confguration working.
Followed instructions posted by n6qw but although I can boot up Quisk i can't see any noise on the graph.
Config says that it cannot open capture device, hw:0 9 (no such file or directory)

regards
Don m5aky

I'd recommend pulseaudio. It makes switching between devices easy. Sudo apt install pulseaudio should do it. Also install pavucontrol if you're running the gui. Then they should all appear as options in the radio config.

Just make sure the sound card is detected first. It should be listed with aplay -l. If not, that needs to be solved.

2518. Quisk Version 4.1.15 March 2018

Yahoo group: n2adr-sdr
Date: 2018-03-21 15:20:49 UTC
From: jahlstr@...
Topic: 2518 Message: 2518

I changed the logic for the PTT keyboard shortcut. If you are using a PTT shortcut key, go to the Config/Radio/Keys screen and check the keys you are using. I made further changes to support Hermes-Lite. And the "darwin" platform was added to defaults. I fixed the Status screen flickering that occurred on Windows.

2522. RIG Control with CAT instead of Hamlib

Yahoo group: n2adr-sdr
Date: 2018-03-22 13:10:58 UTC
From: alex-ritter@...
Topic: 2522 Message: 2522

I use a Logbook (VQ-LOG) which only supports old fashion CAT connections to the TRX.
I did ask the author to support Hamlib, but i think he does not find an easy way to include this feature.

I am wondering if there may exists some middleware software ?!

Maybe you can start a tool which translates the Hamlib Data to a standard Kenwood CAT Protocol (or something similar) and send this data to a virtual Com port ?! I am no programmer so i am not sure if this would be even possible. Maybe there are more simple ways to solve this problem.

I am looking forward for your answers.

Please press the Help button and look for "Hamlib Control". Here is the text:

Most digital decoders and logging programs use Hamlib to control a rig so that frequency changes in one program are recognized in the other. To connect an external program to Quisk using Hamlib, configure your program to use "Hamlib NET rigctl" (rig 2). Then go to the Quisk "Remote" config screen for your radio and set "IP port for Hamlib" to 4532. This assumes you are not using the rigctld daemon program. If you are, set the Quisk port to 4575 and tell rigctld to control quisk on port 4575. You can also control Quisk from another program by using the XML-RPC method if this is available in your program. Fldigi can use this method.

Hi Michael and group.

Thanks for the reply. I have learnt by trial and error that Quisk has to be restarted in order for changes to be made.

The problem is that I am not clear as to what to enter for Radio audio output, microphone input, i/q sanple input and i/q TX output and what to change in the .quisk_conf.py file in order to configure the Softrock. I am using the RxTxEnsemble file which as far as I know works in the same way as the softrock 6.1.

I have had a few helpful suggestions but so far none have worked for me. I don't seem to be picking up anything from the Startech soundcard.

Regards

Don

Dont mix setup processes ...

Quisk.py as i understand it should not be modified. quisk_conf.py is the "old" way to set up your radio.... also can now be specified as the file used at startup .. i use the "radio" tab that i created after copying the ensemble radio type while using the Quisk GUI (program)

I only have info for the one set up procedure.

I have not attempted to modify the quisk.py file or any of the other files in Quisk.

I understand I have to create the file ".quisk_conf.py" in home/pi and copy the contents of the relevant file, in this case RxTxEnsemble into .quisk_conf.py then change it there as required.
I would be interested to learn of any other way of setting up.

2532. Quisk 4.1.15 with Linux Mint: no capture device found

Yahoo group: n2adr-sdr
Date: 2018-04-01 15:19:59 UTC
From: heikki.ahola@...
Topic: 2532 Message: 2532

Hello group !

Made a trial with my ACER Aspire laptop and Linux Mint 17.2. When running Quisk 4.1.15 in the terminal received the following:

```
heikki@heikki-Aspire-8935G ~/sdr1_quisk/quisk-4.1.15 $ python quisk.py
ALSA lib pcm.c:2239:(snd_pcm_open_ noupdate) Unknown PCM cards.pcm.rear
ALSA lib pcm.c:2239:(snd_pcm_open_ noupdate) Unknown PCM cards.pcm.center_lfe
ALSA lib pcm.c:2239:(snd_pcm_open_ noupdate) Unknown PCM cards.pcm.side
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
Cannot connect to server socket err = No such file or directory
Cannot connect to server request channel
jack server is not running or cannot be started
Segmentation fault
```

The QUISK starts but cannot find any capture device (Hermes Lite V1 or V2). Furthermore, the application terminates when trying to open Radio definitions Bands or Fonts. Obviously, something is missing or ill-defined.
Otherwise, the Linux seems to be OK with standard applications.

From: Sid Boyce
Topic: 2532 Message: 2533

Hi HeiKKi,
Apart from the segmentation fault, the messages are all noise and not a problem or contributing to the segmentation fault.
The "pulseaudio-module-bluetooth" package when installed causes the bt_audio noise, likewise the ALSA lib pcm is irrelevant.

Is this an upgrade from an earlier? version that ran?

Does "ldd _quisk.so" show any missing libraries?

The ~/quisk_settings.json file header part of my setup done via the Config button, asks me which Radio to start, choices between HL2_Beta5, ODYSSEY-2 and (HL229) Hermes-Lite V1.

```
------------------------------------------------------------
[
? "Ask me",
? "HL2_Beta5",
? [
??? "ODY-2",
??? "HL229",
??? "HL2_Beta5"
? ],
------------------------------------------------------------
```

I don't currently have them running, but my old config file had the following port specified. From memory, wsjtx used a different port and quisk had to be told to use it. See if there is a place in your radio config for this.

hamlib_port = 4532

From: jahlstr@...
Topic: 2538 Message: 2538

I updated the built in version of FreeDV digital voice. It now includes newer modes such as 700D. I added the column for the IO bus to the Red Pitaya radio. I fixed a bug when selecting the "Bands" screen. I added shortcut keys to the buttons. If a button has an underlined letter, pressing ALT and the letter will press the button. This is convenient for operation, and allows Quisk to be controlled by another program that can generate key presses. If you have set a PTT shortcut key, please check its validity on the radio Keys screen. The shortcut characters for the band buttons can be changed in the config file.

2542. Quisk Waterfall display question....

Yahoo group: n2adr-sdr
Date: 2018-06-01 05:10:49 UTC
From: Rob Frohne
Topic: 2542 Message: 2542

Hi James, et. al.,

I was playing with quisk tonight, and if I open the window up to be full screen, it displays in the spectrum analyzer like view only between -120 and 0 dbm. My noise floor is a bit lower than -120 dbm, and so I'd like to display from -140 dbm and up. If I make the window a bit narrower, then I can see more than just the peaks of the louder signals all the way across the spectrum, but not if I go full screen. Is there an easy way to fix this in the configuration or something?

Thanks & 73,

Rob

It works OK for me on full screen in Graph mode but if I switch to WFall, it won't allow me to go below -120 dB in either full screen or sized window screen modes.

There doesn't appear to be a setting in quisk_conf_defaults.py to do this.

CHANGELOG.txt says...

"Quisk Version 4.1.11 November 2017

The graph Ys and Yz settings are now saved for each band."

This does not work for me on version 4.1.11. Will try a newer version
later.

Hi Nick, et. al.,

Maybe we should add autoscaling, meaning we make sure both the largest
and smallest values are displayed, and then round to the nearest 10 dbm
that works.

From: dh5ym@...
Topic: 2549 Message: 2550

Great! Thanks a lot!
I followed the development and 700D seems to be a real great mode for weak signal voice communication.
The only point that appeared very difficult to me was to set the proper microphone volume in order to reach a good quality at the receiver end.
Have a nice weekend!

2551. On Win7 64bit quisk fails to start for HL2

Yahoo group: n2adr-sdr
Date: 2018-06-25 10:58:46 UTC
From: desai_amogh@...
Topic: 2551 Message: 2551
Attachments: 2 described; binary payloads are missing from this source WARC

I have issues running quisk with HL2 for a long time. My HL2 worked fine with sparksdr/openhpsdr but quisk never discovered it.

I have now freshly installed win7 64 bit, latest python 2.7, wxpyton and latest quisk today. if I open quisk without any configuration, it starts without any issue. Once I add HL2 config as per this guide by Steve https://www.youtube.com/watch?v=1pPbQplSBoo&feature=youtu.be it doesn't restart.

I also tried the following C:\Python27\pythonw.exe -vvv WinQuisk.pyw with verbose output and it pops up the below wxpython screen and vanishes in few seconds without letting me see the final error output.

http://quisk.973856.n3.nabble.com/file/n4024380/Capture.png
http://quisk.973856.n3.nabble.com/file/n4024380/Capture.png

http://quisk.973856.n3.nabble.com/file/n4024380/Capture.png

http://quisk.973856.n3.nabble.com/file/n4024380/Capture....
http://quisk.973856.n3.nabble.com/file/n4024380/Capture.png

View on quisk.973856.n3.nabbl...
http://quisk.973856.n3.nabble.com/file/n4024380/Capture.png
Preview by Yahoo

Also, there are 2 files under this directory: C:\Users\amogh\Documents
.quisk_init.pkl http://quisk.973856.n3.nabble.com/file/n4024380/.pkl
quisk_settings.json http://quisk.973856.n3.nabble.com/file/n4024380/quisk_settings.json

I have attached them.

If I delete these files, quisk starts back as the HL2 config gets deleted.

Is this a usual issue on Win7? how to redirect output of wxpython to a text file?? how to fix this issue?

Please help.

2552. Re: On Win7 64bit quisk fails to start for HL2

Hello,

To get error messages in Windows, run Quisk from a terminal window. Change directory to the Quisk directory, and enter:

c:\python27\python.exe quisk.py -a

The "-a" causes Quisk to ask which radio you want to run, ConfigFileRadio or HL2. Select HL2 and look for the output.

I ran Quisk on my Windows 10 machine here with your .quisk_init.pkl and quisk_settings.json files. It showed a bug in the latest release 4.1.19 with the "Audio" band. To work around it, start with CondifFileRadio and select the 40 meter band, then exit. Then Quisk will restart with 40 meters instead of Audio. But I doubt this is the problem you are having. Post any error messages you get.

You could also try temporarily turning off Windows Firewall and see if that helps.

Thank you Jim,

Setting the band to 40 on ConfigFileRadio and restarting to HL2 Radio did the trick.

2554. Virtual Box installation.

Yahoo group: n2adr-sdr
Date: 2018-07-02 18:12:18 UTC
From: artus1947@...
Topic: 2554 Message: 2554

Folks,
I am trying to bring up Quisk 4.1.19 under a VirtualBox -- Mint 18.3 running on my MacBook Pro High Sierra. I have my HL2 connected directly through an ASIX Gigabit USB Adapter. I can ping the HL2 at 169.254.19.221. Both SparkSDR and LinHPSDR find and work with this arrangement. Quisk comes up with a "No capture device found." With Wireshark running, I see no activity when I launch Quisk, unlike either SparkSDR or LinHPSDR which both show negotiations. I have tried leaving the IP address blank and putting in 169.254.19.221 using both a 255.255.0.0 and 255.255.255.0 masks. I have the audio set to Pulse Default. I have Quisk running on many other platforms Windows10, Mint 18.3, RP3, etc., but not under a Virtual Box. I have also tried launching from OSX directly but no joy (it launches but python (Python 2.7.15 & 4.0.2 osx-cocoa (phoenix) wxWidgets 3.0.5) is very slugish and eventually hangs) Any thoughts.

P.S. I did have the glitch with the "Audio band" preventing launching as noted by Jim on this group.

2558. Quisk with Afedri

Yahoo group: n2adr-sdr
Date: 2018-07-04 05:14:14 UTC
From: Doug
Topic: 2558 Message: 2558

I want to implement Quisk with my remote Afedri receiver. I have a zip archive of the Afedri interface files from the Afedri site and Ubuntu 16.04 with Quisk installed from the package manager which is version 3.7.6. Are there instructions anywhere on how to make this work together? What files are copied where? Any help would be greatly appreciated.

Doug

Dough, At first try to install, configure and run Quisk with PC's sound card to test you installation.
You can use AFEDRI connected to PC through USB as sound device too.

For network conenction You need to:
1. extract files from archive,
2. create the new folder in quisk directory, you can name this folder for example - afedrinet
3. copy all files from archive into this new folder
4. change corrent path to this new folder
5. compile binary running afe_library script , if it will not compile and give you error, you should change afe_script paths according your Linux installation (for example path to Pyhton , libraries etc.)
6. change definitions in afedri hardware related configuration file quisk_conf_linux.py
7. change current directory to quisk root.
8. Run quisk with afedrinet using command like this:

quisk.py -c afedrinet/quisk_conf.py

More information you can find in Quisk documentation in the section about custom hardware.

73!
Alex

2560. Re: [n2adr-sdr] Re: Quisk with Afedri

Topic: 2558 Message: 2560

Alex,
Thanks for your prompt response. I am not clear where the "quisk" folder is in my package installed quisk. This is a long list but here is what I have in Ubuntu 16.04. Quisk does work and seems to see my sound card as I hear hiss audio and can select filters, etc. So which of these constitutes the "quisk" directory?

locate quisk

Doug, Where is the quisk located - it is better to ask Quisk author :-)
It seam to me that it is sitting inside : /usr/lib/python2.7/dist-packages/quisk
I do not think it is the good thing to edit and compile files in this directory.
So you will need to change something in sequence.I do not recommend edit files located in /usr folder, it is not good idea for security and OS .

I am installing Quisk manually in my home directory, if you choose automatic installation - you have to ask package contributor where is it.
By the way I suppose that hardware (afedri) related directory can be placed in any folder, only you will need to change accordingly configuration files that you are using to start quisk - never tested that variant.

So please open your mind in Linux way :-)

Alex,
 OK here is what I did. I uninstalled the package quisk and installed the latest version from the website in a known directory. I then followed your directions and compiled the afe_library successfully. I then configured the conf file with IP address. It apparently connects but no waterfall or sound output. I am doing this remotely so i want the sample rate to be the lowest. In SDR-radio it is 50Khz but I am not sure how to set it here or if this is even the problem. SDR-radio works to the remote afedri. Here is what is in the file -

```
rx_udp_clock = 79998382                 # ADC sample rate in Hertz
#rx_udp_decimation = 8 * 8 * 8          # Decimation from clock to UDP sample rate
#sample_rate = int(float(rx_udp_clock) / rx_udp_decimation + 0.5)       # Don't change this
data_poll_usec = 10000
#sample_rate = 192000                   # ADC hardware sample rate in Hertz
sample_rate = 740740                    # ADC hardware sample rate in Hertz
playback_rate = 48000                   # Radio sound play rate
name_of_sound_capt = ""#AFEDRI-SDR-Net Audio"
```

Hello Sid,

I have wxPython 3 on my Windows machine and it works fine. I will have to install Ubuntu 18 to fix this. The general release should be available soon.

Jim

Hi Jim,
18.04 LTS was officially released on April 26 and 18.10 is scheduled for
a release date of October 18.
I upgraded the x86_64 boxes back in April and in the last week the 3
ODROID-C2's including the one in the standalone HiQSDR.
73 ... Sid.

Doug, I do not understand why do you ignoring configuration file that I intentionally put into afedrinet folder?
I mean file that have name quisk_conf_linux.py and it looks like:

```
from afedrinet import quisk_hardware # Use different hardware file
use_rx_udp = 1 # Get ADC samples from UDP
rx_udp_ip = "192.168.0.8" # Sample source IP address
rx_udp_port = 50000 # Sample source UDP port
rx_udp_clock = 80000000 # ADC sample rate in Hertz
data_poll_usec = 10000

sample_rate = 740740 # ADC hardware sample rate in Hertz

playback_rate = 48000 # Radio sound play rate
name_of_sound_capt = "" # Name of soundcard capture hardware device.
name_of_sound_play = "hw:0,0" # Use the same device for play back.
latency_millisecs = 50 # latency time in milliseconds

display_fraction = 0.92 # The edges of the full bandwidth are not valid
default_rf_gain = 14
default_screen = 'WFall'
```

Please look well at this file...

From: gvjury@...
Topic: 2203 Message: 2566

When changing modes the filter shadow does not alter to reflect the bandwidth. I am not certain if the mode actually changes as I have not found someone to talk to yet.

When using pulse audio the radio very frequently crashes but works fine on alsa. This is just a heads up at present as I have done no debugging yet.

Another issue which is only a cosmetic bug is that the menu defaults to the last entry i.e. 700D in my case, rather than the first. Below is my config setup for FreeDV. I have tried using the lib files supplied with quisk and also tried transferring the compiled library file from David's svn to the quisk/freedvpkg directory.

```
## freedv_tx_msg FreeDv Tx message, text
# For freedv, this is the text message to send.
#freedv_tx_msg = ''
freedv_tx_msg = 'ZL2APV Graeme, New Plymouth, RF70bw \n'

# This is the list of FreeDV modes and their index number. The starting mode is the first listed.
freedv_modes = (('Mode 1600', 0), ('2400A', 1), ('2400B', 2), ('800XA', 3), ('Mode 700', 4), ('Mode 700B', 5), ('700C', 6), ('700D', 7))
```

Alex,
 Finally getting back to this. I have it working at my home QTH where the Afedri is on the same LAN. It works well but nothing I change in the config file regarding sample rate seems to change anything. It is stuck on 370370 in the config screen. I believe this was my problem using it remotely as I cannot run that bandwidth remotely. I would be happy with 48khz. Do you have any idea why it does not seem to be responding to changes? Other things like the playback soundcard are read fine. Also if this did work what sample rates are allowed? It almost seems like these numbers are compiled in.

Hi Dough,
At first sample-rate settings should work well when you pressing the "Config"button in Quisk application.
the number that is placed inside config file is initial (default) value only.
So to change the sample rate please press "Config" button and go to "Config" tab there, choose desired sample rate from the list, list has the next values"
53333
96000
133333
185185
192000
etc,
If you have the standard AFEDRI SDR-net, the choose of 53333 hz - is more correct than 48000 Hz.

Alex, Thank you, that works fine. I feel stupid as because Quisk is so config file oriented I did not even think of doing it there. It always comes up in the sample rate you last selected but it does not change the config file. Where is this stored? Now I can test it from my remote location. Thanks again for your expert help.

Alex,
 I am at my remote location and although quisk comes up, it is not getting data from my remote Afedri. SDR Console does so I know the link is working.
The Ubuntu here is 2.7 and is running in 64 bit. I suspect that could be a problem as I saw something about that in the docs. If it is, is there a way to run it in 32 bit mode. I see google reference to using python2.7-32 but no such thing exists on my system. Do I need to compile a version for 32 bit or is there an easier way to do it?

Hi Dough, 1. I suppose that the fact that you have problem to get UDP data from AFEDRI through internet, when on local network it is working, have no any connection to Python version and bits number of the Python and OS.
To get UDP working over internet you must configure portmapping for AFEDRi internet router on both sides port (to connect port to SDR and client IP 50000 - default) .
The AFEDRI SDR-Net allows automatic port mapping for client application for UDP when proper procedures used, this port mapping is not implemented in Quisk package.
So when SDR used with SDR_Network_Control_box plugin as ExtIO for HDSDR - client's port will be mapped automatically, but on the server side (SDR side) you must configure port mapping on the inetrnet router in any case.

2. All questions relatively to required Python version and QS/Python/Quisk bits number - you have to ask Quisk developer...

Alex,
   Port forwarding is NOT the problem. That has been in place at both ends and working fine. The SDR console in Windows works with Afedri remotely on the same computer.

Dough, If you know how to make SDR_Console to work with AFEDRi over internet, so Quisk should not be a problem too. Only make correct configuration.
I cannot give better advice.
Can advice only to bring AFEDRI to remote site and try it's work on local network at first.

May be you missed something that was done on the other computer.

In connection to 32/64 bit Pyhton-Qusik dependence - it is out of my knowledge.

Alex,
  Eureka, got it. My fault. For some reason my IP address at the Ubuntu remote computer had changed and thus the port forward to 50000 was not correct. Thanks for your help and sorry for all the chatter. I had thought that sdr-console required that because it was working fine without it being correct so I did not check it.

Topic: 2578 Message: 2578

Hi All,

I have currently blowing the dust of my HIQSDR radio :-)
Installed the latest version og QUISK (Windows) and got it running with the default IP address(192.168.2.196). I would like to have the radio on my local net with 192.168.1.196.
I tought that was possible with the seting in the menue that you could change the IP to XXXXX1.196 and the change to a static IP on my computer to XXXXX1.97.
When i do dthat i dont get the connection, and i am not able to ping the radio with he new IP. Old IP all is good.
I have quisk ver 4.1.21 and firmware 1.4. Any idea ?

Sid!

Thanks for info. On a Windows platform, you can assign two staticIP address on you Ethernet card. The function is under the advanced settings.IE, 192.168.1.196 and net mask 255.255.255.0 the 192.168.2.196. I have donethis and it work via my switch however, it does not really solve the function tochange the IP address in the software. When I change the IP in Quisk software,do the settings “true”, and restart the software, that radio does not take thenew IP. I am not able to ping the new IP address only the old IP(192.168.2.196). Even after, I change the static IP in the computer to be onthe same subnet.

Hi Rune,
I think this is one for Jim to solve.
Currently my HiQSDR standalone is on my LAN as 192.168.10.238 mainly for software updates and I have a USB dongle connected to the HiQSDR accessible as 192.168.2.196.

The enclosure houses the HiQSDR/Preselector/10W PA connected to an ODROID-C2 with a 7 inch touchscreen, keyboard and mouse as needed.

Hi Rune and Sid,

I too thought that recent software would let you change the IP address but it did not work for me either. To get over the issue, I changed the netmaask on my IPV4 to netmask = 255.255.252.0 which then lets me access 192.2.nnn.nnn but I would prefer to change HiQSDR to 192.168.1.196 also.

Hello,

The feature to change the IP address to 192.168.1.196 requires version 4 of my firmware. What firmware are you using? I don't think the firmware by DL2STG implements this feature.

Hi Rune,
http://james.ahlstrom.name/transceiver/fpga_ver4.zip which is described on hiqsdr.com as version 1.4 which you say is already installed:-
The firmware *version 1.4* allows you to change the IP address of the hardware from the PC instead of using the address programmed into the firmware. It also changes FPGA pin 56 to be an output pin; high for normal, and low for full duplex (FDX) operation.
73 ... Sid.

Hi Sid,
Thanks for info. Yes, this is how I understand it as well and I guess that firmware has not been updated since ?.Attached is a screen grab of the software that tells me that this is ver 1.4 (or ver4).Wonder if I should flash the firmware again but should not be necessary since all seems to work nicely.

Hi Rune,
http://james.ahlstrom.name/transceiver/fpga_ver4.zip which is described
on hiqsdr.com as version 1.4 which you say is already installed:-
The firmware *version 1.4* allows you to change the IP address of the
hardware from the PC instead of using the address programmed into the
firmware. It also changes FPGA pin 56 to be an output pin; high for
normal, and low for full duplex (FDX) operation.
73 ... Sid.

Hi Marc,
It's worth trying.
Currently I am using the DL2STG's firmware fpga_ver3-sg9.tgz
73 ... Sid.

All,
I downloaded the firmware from the link Sid provided me (from James web site) and flashed it las night, now I can change my IP address.I dont see any different in firmware version however all is good now :-) Thanks all for help and input. The next step must be to get this running on a Linux system. I do have a older laptop that I can use.

Excellent, glad to hear that issue is fixed.

Getting it running with quisk should be easy.

When installing quisk on a new ODROID-C2 Ubuntu image? I did not use a
~/.quisk_conf.py.
I used the Config tab to build a ~/quisk_settings.json file.
I did the same on my x86_64 boxes.
73 ... Sid.
